Creating Effective Small Group Learning (SGL)

Jim Borgford-Parnell
Center for Engineering Learning and Teaching
UW College of Engineering
Terms Related to SGL

- Active Learning
- Collaborative Learning
- Cooperative Learning
- Engaged Pedagogy
- Problem-Based Learning (PBL)
- Case Study
- Project-Based Learning (PBL)
- Peer Instruction
- Team-Based Learning
Workshop Goals

1. Expand your SGL conceptual framework
   - Benefits of SGL
   - Types of SGL
   - Key elements of SGL
   - Implementing SGL in your course
     - Selecting groups
     - Designing tasks
     - Assessment
     - Common problems
     - Student resistance

2. Participants leave with something helpful

Applying the Science of Learning to the University and Beyond

- Practice at retrieval promotes long-term retention.
- Varying the conditions results in better learning.
- Re-presenting information in alternative formats enhances learning.
- Learning depends on prior knowledge.
- Learning is influenced by our ideas about learning.
- Experience alone is a poor teacher.
- Lectures don’t promote deep understanding.
- The act of remembering enhances the ability to remember.
- Understanding a few things well beats understanding a lot superficially when it comes to retention.
- How learning occurs determines how and when knowledge may be recalled.

Key findings in *How People Learn*

- Students come to the classroom with preconceptions that must be engaged or they will leave with the same conceptions.

- Competence results from: (a) a base of factual knowledge; (b) knowledge built in context of a conceptual framework; and (c) knowledge organized for retrieval.

- A metacognitive approach makes for better learning and better learners.

Principles for Learning Activity and Instructional Design (PLAID)

Source information:
- Learning is influenced by our ideas about learning.
  

= PLAID:
1. Take a little time to explain why group activity can help students achieve desired learning objectives. Be somewhat transparent regarding decisions that affect students’ learning.

Source information:
- Students come to the classroom with preconceptions that must be engaged or they will leave with the same conceptions.
  

= PLAID:
1. Use knowledge probes to find out what students already know or think about a topic. Small groups can be safe and comfortable environments for discussing different perspectives and/or understanding of particular topics.

Research

Meta-analysis of 305 studies

- Cooperative efforts promote greater liking among students.
- Students learning cooperatively perceive greater social support (academically and personally) from peers and instructors.
- Cooperation promotes higher self-esteem.
- Students in cooperative groups become more socially skilled.

Research

A meta-analysis of 168 rigorous studies, comparing efficacy of individualistic, competitive, and cooperative learning.

- CL promotes higher individual achievement.
- Students scoring at 50th percentile level when learning competitively will score in 69th with CL.
- Students scoring at 53rd percentile level when learning individualistically will score in 70th with CL.

Figure 1. %<Gain> versus %<Pretest> scores on the conceptual Mechanics Diagnostic (MD) or Force Concept Inventory (FCI) tests for 62 courses enrolling a total N = 6542 students: 14 traditional (T) courses (n = 2084), which made little or no use of interactive engagement (IE) methods, and 48 IE courses (n = 4458), which made considerable use of IE methods. Slope lines for the average of the 14 T courses <<g>>14T = 0.23 ± 0.04 (SD) and the 48 IE courses <<g>>48IE = 0.48 ± 0.14 (SD) are shown. The negative-slope straight lines are lines of constant, normalized average gain <g> = <Gain>/maximum possible <Gain> = (%post – %pre) / (100 – %pre).

Small-group learning in postsecondary science, mathematics, engineering, and technology (SMET). 383 reports from 1980 or later, 39 of which met the rigorous inclusion criteria for meta-analysis.

The main effect of small-group learning on achievement, persistence, and attitudes among undergraduates in SMET was significant and positive. Mean effect sizes for achievement, persistence, and attitudes were 0.51, 0.46, and 0.55, respectively.

Outcomes: Gains

- Achievement and retention
- Critical thinking and higher-level reasoning
- Differentiated views of others
- Accurate understanding of others' perspectives
- Liking for classmates and teacher
- Liking for subject areas
- Teamwork skills

Informal SGL

- Used to break-up a lecture
- Used to counteract student passivity
- Can be used at any time
- Can be short term and ad hoc
Book Ends on a Class Session

Quick Thinks

- Reorder the steps
- Paraphrase the idea
- Correct the error
- Support a statement
- Select the response

Two Student Activities

- Think Pair Share
  - Turn to your neighbor exercise
  - Works well in large classes
  - Allows rehearsal

- Cooperative Dyads
  - Collaborative reading method
  - Roles: Recaller & Listener

Applying the Science of Learning

- Practice at retrieval, promotes long-term retention
- Varying the conditions results in better learning
- Re-presenting information in alternative formats enhances learning
- Learning depends on prior knowledge
- Learning is influenced by our ideas about learning
- Experience alone is a poor teacher
- Lectures don’t promote deep understanding
- The act of remembering enhances ability to remember
- Understanding a few things well, beats understanding a lot superficially when it comes to retention.
- How learning occurs determines how and when knowledge may be recalled.

Formal SGL

Structured activities that generally involve out-of-class work. Tasks often involve:

- Learning new conceptual/procedural material
- Peer Composition or Editing
- Reading Comprehension/Interpretation
- Problem Solving, Project, or Presentation
- Review/Correct Homework
- Constructive Academic Controversy
- Group Tests
Criteria for Effective Formal SGL

- Individual Accountability
- Positive Interdependence
- A Challenging Task
- Timely Feedback
SGL Structured Activities

- Jig Saw (I & II)
- Problem-based
- Case study
- Send a Problem
- Peer questioning
- Consensus groups
- Group quizzes
Jig Saw II

- Divide problem or task into parts with relatively equivalent difficulty/complexity
- If 4 parts then each home group has 4 members
- Each member leaves home group to work with a separate expert group.
- When expert groups have completed their part and practiced teaching strategies they reform home groups and share with teammates.

Problem Based Learning (PBL) Format

- TASK: Solve the problem(s).
- INDIVIDUAL: Estimate answer. Note strategy.
- COOPERATIVE: One set of answers from the group, strive for agreement, make sure everyone is able to explain the strategies used to solve each problem.
- EXPECTED CRITERIA FOR SUCCESS: Everyone must be able to explain the strategies used to solve each problem.
- EVALUATION: Best answer within available resources or constraints.
- INDIVIDUAL ACCOUNTABILITY: One member from your group may be randomly chosen to explain (a) the answer and (b) how to solve each problem.
- EXPECTED BEHAVIORS: Active participating, checking, encouraging, and elaborating by all members.
- INTERGROUP COOPERATION: Whenever it is helpful, check procedures, answers, and strategies with another group.
Send a problem

- Multiple groups.
- Multiple problems related to a topic.
- Problems rotate.
- Each group solves, adds solution to envelope, and then sends a problem.
- Final group analyzes solutions for one problem and reports out.

Guided Peer Questioning

- Teacher selects a set of question stems that encourage higher level thinking.
  - Why is X happening?
  - What is a counter-argument for X?
  - How could X be used to X?
  - What is a new example of X?

- After material is presented students are asked to develop 2-3 questions about the material using question stems.

- Pairs are formed and questions asked in turn.

Peer Questioning Activity

How can small groups be used to help X?

- Practice at retrieval, promotes long-term retention
- Varying the conditions results in better learning
- Re-presenting information in alternative formats enhances learning
- Learning depends on prior knowledge
- Learning is influenced by our ideas about learning
- Experience alone is a poor teacher
- Lectures don’t promote deep understanding
- The act of remembering enhances the ability to remember
- Understanding a few things well, beats understanding a lot superficially when it comes to retention
- How learning occurs determines how and when knowledge may be recalled
Implementing SGL

- Examine the scope of your course.
- Form groups.
- Design appropriate tasks.
- Address group practices.
- Design assessments that foster positive interdependence and individual accountability.
- Address problems actively and proactively.
Examine the scope of your course

- Start with your learning objectives.
- Confront “coverage” concerns head-on.
- Decide where you want to be on the Informal to Formal SGL continuum.
Forming Groups

- How many students in a group?
- Teacher Selection or Student Selection?
- Collecting helpful data.
Benefits of student-selected groups

- Often quicker to form into groups.
- Transfers more responsibility to students.
- Students often consider schedule-compatibility for longer-term groups.
Problems with student-selected groups

- Students of similar abilities and aptitudes tend to congregate.
- Pre-existing relationships tend to dominate group dynamics.
- Under-represented or shy students are often left out or left until last.
- Selection is not driven by cognitive and affective goals.

Benefits of teacher-selected groups

- Heterogeneity is more easily achieved.
- Student schedule-compatibility for out-of-class activities can be pre-determined.
- Multiple goals can be addressed.
Criteria for forming groups

- Heterogeneity.
- Teacher selected.
- Plan for under-represented students.
- Ensure common blocks of time.
Design appropriate tasks

- Informal tool, formal technique, or strategy?
- For what outcome?
  - Cognitive rehearsal?
  - Conceptual change?
  - Critical thinking?
  - Teamworking skills
- How large are your groups?
“As members of a team, individual students become willing to commit to a very high level of effort in their learning, and learning teams are capable of solving problems that are beyond the capability of even their most talented members.”

Address group practices

- Communicate the importance of group-work on the first day.
- Stress positive interdependence and individual accountability.
- Let students know your grading plan.
- Set clear expectations.
- Discuss group function guidelines and get students involved.
Myths about SGL Assessments

- If you assess student learning, you have to give students grades.
- Faculty must read every student paper and provide feedback.
- Students are not capable of meaningful involvement in assessment.
- Involving students in assessment takes valuable time away from learning and lowers their achievement.
- Assessment is a faculty responsibility, not to be done by students.
- Individual assessment is lost in team-based approaches to assessment.
Design assessments that foster positive interdependence and individual accountability

- Make assessments meaningful.
- Use a criterion-referenced system for all assessment and evaluation.
- Use a variety of assessments.
- Directly involve students in assessing each other's participation in the group.
- Use assessments as pedagogical tools.
Making Assessments Meaningful

1. To be meaningful, assessment has to have a purpose that is significant.
2. Assessments are meaningful when students are involved in conducting the assessment.
3. Meaningful assessments provide a direction and road map for future efforts to learn.
Address problems actively and proactively

- The best way to address problems is to structure groups so they don’t occur.
- Give students enough guidance and authority to work out minor problems themselves.
- Build in diagnostics.
- Plan for interventions.
- Plan for dissolving groups, firing members.
“Engaging students in learning is principally the responsibility of the teacher, who becomes less an imparter of knowledge and more a designer and facilitator of learning experiences and opportunities. In other words, the real challenge in college teaching is not covering the material for the students; it’s uncovering the material with the students.”
