

The Pelini Lab seeks students interested in assessing the effects of climate change and disturbance (e.g., fire) on above- and belowground arthropod-dominated food webs. We work in multiple locations including the eastern US (e.g., Harvard Forest) and the Great Lakes region (e.g., University of Michigan Biological Station). See <http://personal.bgsu.edu/~spelini/> for more information.

Bowling Green State University, OH (17,000 students) is at the western end of Lake Erie, and in close proximity to remnant oak-savanna, prairies and fragmented forest-agroecosystem complexes. With a low cost of living and recognized as one of the best cities in Ohio, Bowling Green is also within easy driving distance of Columbus, Ann Arbor, Chicago, and Cleveland.

Interested candidates should contact us at spelini@bgsu.edu. Please include a CV, a brief overview of your previous research experience and interests, GPA, and GRE scores (if available).
