

- Where do the problems occur?
- What provides coherence? (i.e. links req's to design to code to test?)

Test-Driven Development

How does TDD impact the development process?

- I unit test everything I can
- Which leads me to write smaller, more testable units
- Which leads me to design looser couplings
- Which leads me to change my testing to be more efficient (going "meta")
- All of which allows me to more quickly inquire about whether the program is what I want in the first place
- And the cycle continues ...
- Putting testing at the heart of software development isn't just about making software correct; it is about better requirements, better designs, better testing ... better everything.
