

Installation for Windows

Unpack the downloaded .zip archive. It will unpack into a folder called "ethotimer". Inside that folder, double click EthoW.exe to start the program. If that doesn't work, use the command line (or write a .bat file) by typing `java -jar Etho.jar` from the ethotimer directory. The download also includes a file "ethoprefs.serial" (contains saved preferences) and a required subfolder called "support", which contains sound resources, documentation, etc. You may need to get the current Java Runtime Environment from Sun (<http://java.com/en/index.jsp> - click "Download Now" button).

Installation for Mac OSX

Unpack the downloaded .zip archive (it may happen automatically). It will unpack into a folder called "ethotimer". Inside that folder, double click "Etho.jar" to start the program. The download also includes a file "ethoprefs.serial" (contains saved preferences) and a required subfolder called "support", which contains sound resources, documentation, etc.

Installation for Linux

Unpack the downloaded .zip archive. It will unpack into a folder called "ethotimer". Inside that folder, double click "EthoLinux" to start the program. If that doesn't work, use the command line to start the program with the "Etho.jar" file (`java -jar Etho.jar`). The download also includes a file "ethoprefs.serial" (contains saved preferences) and a required subfolder called "support", which contains sound resources, documentation, etc. You may need to get the current Java Runtime Environment from Sun (<http://java.com/en/index.jsp> - click "Get it Now" button).
