

# Neighborhood Effects and Depression: Associations with Adolescents' Sexual Behavior

Lonny Born  
MPA/MPH Candidate  
Health Services  
University of Washington

Research Festival  
June 6, 2007

# Preface

- This is a presentation of my work-in-progress.
- Everything being presented is preliminary.

# Background and problem

## **The risk: Adolescent sexual activity (ASA)**

- Studies involving adolescent youth populations have found associations between sexual risk behaviors and mental health problems, sexual risk behaviors and social environment, and sexual risk behaviors and a combination of both mental health and social environment. (Sampson, et al 2002; Berkman and Kawachi, 2003; Diez-Roux, 2000)
- Neighborhood processes appear to have relationships with mental health outcomes. Adolescents in high-risk neighborhoods present a higher symptom count for internalizing behavior such as depression and anxiety disorders and lower self-esteem. (Chen, 1997)
- How social context and the neighborhoods causally shape behaviors have methodological challenges in understanding the effects. (Oakes, 2004)

# Research Questions and Purpose

- 1) Do perceptions of neighborhood factors play a role in determining adolescent sexual outcomes?
- 2) Is depression a predictor of sexual activity?

# Study Design and Analysis

- Descriptive, Cross-sectional design
- The study sample includes 1,615 adolescents ages 14 – 18 interviewed in the 2004 wave of the National Longitudinal Study on Youth (NLSY) – Child Young Adult cohort.

# Conceptual Model

## Predictors (Independent variables)

### Perception of Neighborhood

#### Attributes

Neighborhood quality index  
and peer, individual drinking

### Depression

(CES-D/ 7  
questions)

### Control Variables

#### Demographics

- Race/Ethnicity
- Age
- Region; Urban-Rural

#### Family

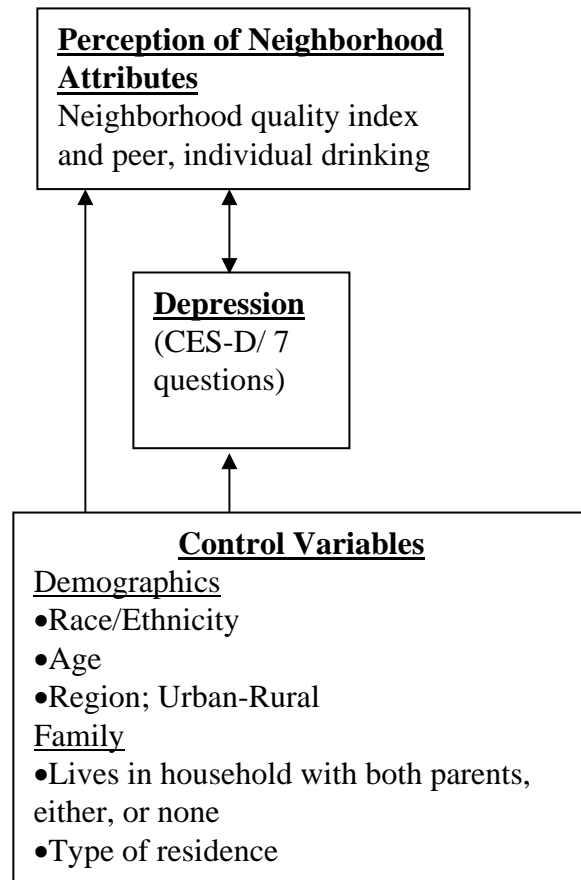

- Lives in household with both parents,  
either, or none
- Type of residence

## Dependent (Outcome) variables

# Conceptual Model

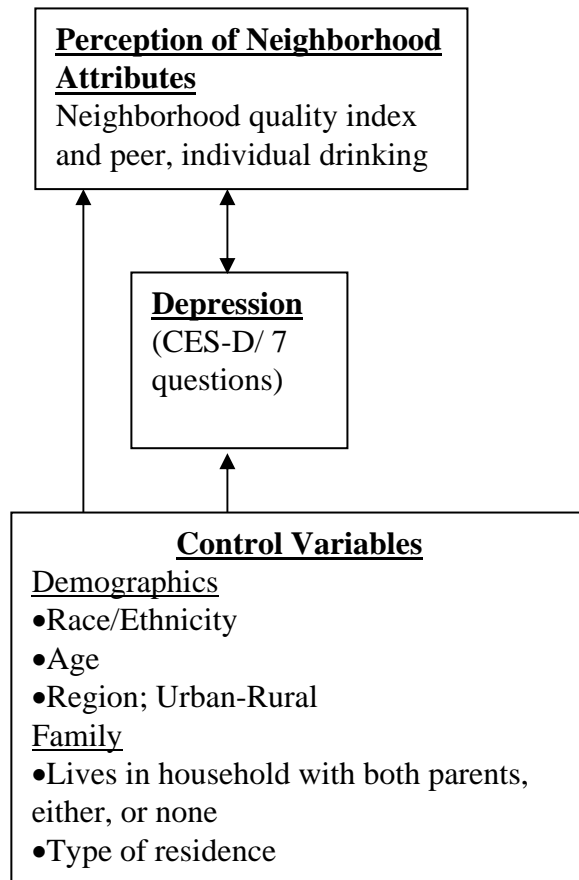

**Predictors (Independent variables)**

# Methods

- *Logistic regression* modeled specific aspects of adolescent sexual activities as functions of neighborhood factors and symptoms consistent with CESD controlling for important family and individual characteristics.
- *Effect modification* by gender will be assessed using formal Chow tests. Sample weights will be applied in all models to account for the complex survey design. (underway)

# Preliminary Results – Table 1

**Table 1: Pooled (boys and girls) behavior of Adolescents Age 14 - 18 years, NLSY 2004. (n=1,615)**

<b>Predictors</b>	<b>Asked if Ever had sex? (Y/N)</b>			
	<b>Y</b>	<b>%</b>	<b>N</b>	<b>%</b>
<b>Overall</b>	443	27.4	1,172	72.6
<b>Depressed (CESD)*</b>	25	5.6	67	5.7
<b>Perception of Neighborhood Attributes</b>				
Peer drinking				
Big problem	124	28.0	120	10.2
<b>Individual drinking</b>	156	35.2	287	24.5
<b>Neighborhood Quality Index**</b>	mean=	s.d.=	mean=	
	18.5	2.9	19.0	s.d.= 2.5
<b>Used a condom?</b>	274	61.9	169	14.4
<b>Many partners?</b>	170	38.4	273	23.3

\*Weighted sum using the Center for Epidemiologic Studies Depression Scale

\*\*Using a neighborhood quality index: groups, no job, don't care, supervision, police, rundown, violence, rules

s.d=standard deviation

# Preliminary Results – Table 2

**Table 2: Logistic Regression Model of Adolescents asked about having sex (n=1,615) <sup>a</sup>**

Predictors	OR	p
Neighborhood Quality Index	0.96	0.235
Neighborhood perception of others drinking	1.98	0.000
Depressed	1.35	0.394
Individual drinking	4.84	0.000

a Model controlled for age, sex, race (white=ref, black, Hispanic, other), depression, drinking, region, truncated income (log-transformed)

OR=Odds ratio; CI=confidence interval

# Preliminary Results – Table 3

**Table 3: Logistic Regression Model of Adolescents  
Ever having sex. Used a condom? (n=433) <sup>a</sup>**

Predictors	OR	p
Neighborhood Quality Index	1.07	0.148
Neighborhood perception of others drinking	0.84	0.498
Depressed	1.06	0.909
Individual drinking	0.74	0.246

<sup>a</sup> Model controlled for age, sex, race (white=ref, black, Hispanic, other), depression, drinking, region, truncated income (log-transformed)

OR=Odds ratio; CI=confidence interval

# Preliminary Results – Table 4

**Table 4: Logistic Regression Model of Adolescents Ever having sex with more than one partner in a year? (n=433) <sup>a</sup>**

Predictors	OR	p
Neighborhood Quality Index	0.98	0.688
Neighborhood perception of others drinking	0.82	0.462
Depressed	2.65	0.107
Individual drinking	2.97	0.000

a Model controlled for age, sex, race (white=ref, black, Hispanic, other), depression, drinking, region, truncated income (log-transformed)

OR=Odds ratio; CI=confidence interval

# Preliminary Conclusions

- 1) Do perceptions of neighborhood factors play a role in determining adolescent sexual outcomes?
    - ◆ Drinking is highly significant in ASA
  - 2) Is depression a predictor of sexual activity?
    - ◆ Depression has is moderately significant effect in ASA
    - ◆ Depressed girls are more likely to be in involved ASA than boys.
- If effect modification, this would allow for targeted public health action
  - Drinking is a strong predictor, allows for community level programming

# Limitations

- Incomplete, i.e. on-going, analysis
- Sample size for depressed and sexually active adolescents is small
- Reporting bias
- Limited ability to address causality
- Explanatory power of different variables cannot be examined.

# A Kind Thank you!
