

# Climate Change & Climate Adaptation in Wetland Ecosystems

Maureen Ryan, University of Washington  
Meghan Halabisky, University of Washington  
& many collaborators

# Many Collaborators

Alan Hamlet, University of Washington

Se-yeun Lee, University of Washington

Wendy Palen, Simon Fraser University

Nick Dulvy, Simon Fraser University

Mike Adams, USGS & Oregon State University

Lara Hansen, EcoAdapt

Regina Rochefort, North Cascades National Park

Reed Glesne, North Cascades National Park

Barbara Samora, Mt. Rainier National Park

Steve Fradkin, Olympic National Park

Jerry Freilich, Olympic National Park

Betsy Howell, US Forest Service

Karen Pope, US Forest Service

Justin Garwood, California Dept. of Fish & Game

Jonah Piovia-Scott, University of California Berkeley

# Important Resources

- Climate Impacts Group
- UW Remote Sensing & Geospatial Analysis Lab
- Wetland inventory data
  - National Park Service
  - USGS Amphibian Research & Monitoring Initiative
  - US Forest Service
- Demographic datasets for *Rana cascadae*
  - Wendy Palen & Mike Adams (Olympics)
  - Karen Pope & Justin Garwood (Trinity Alps)

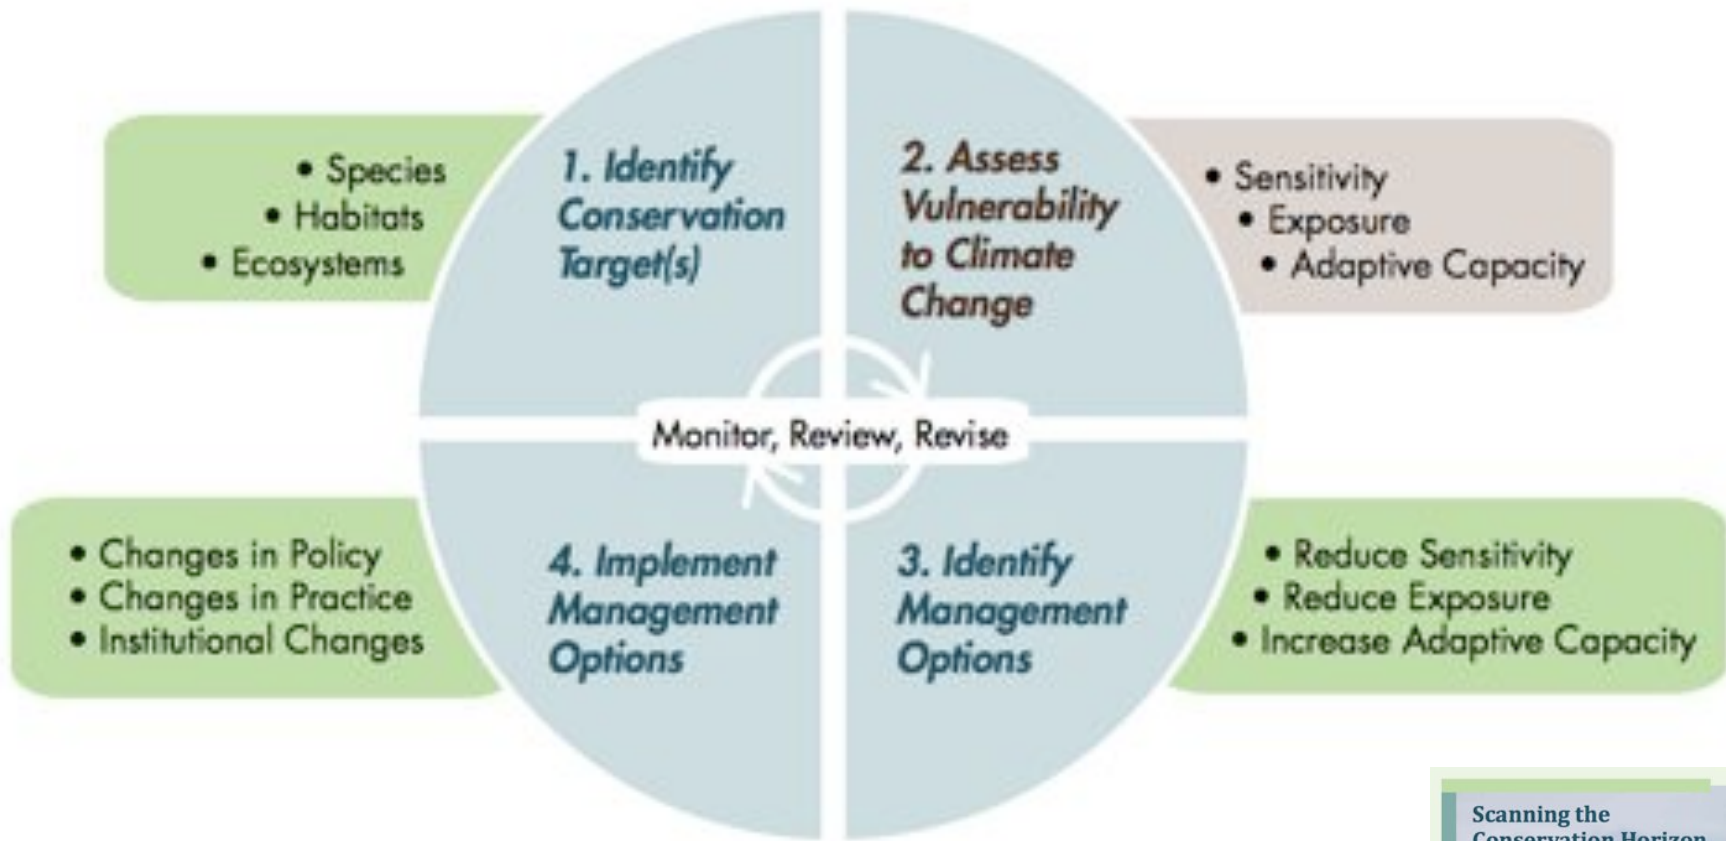

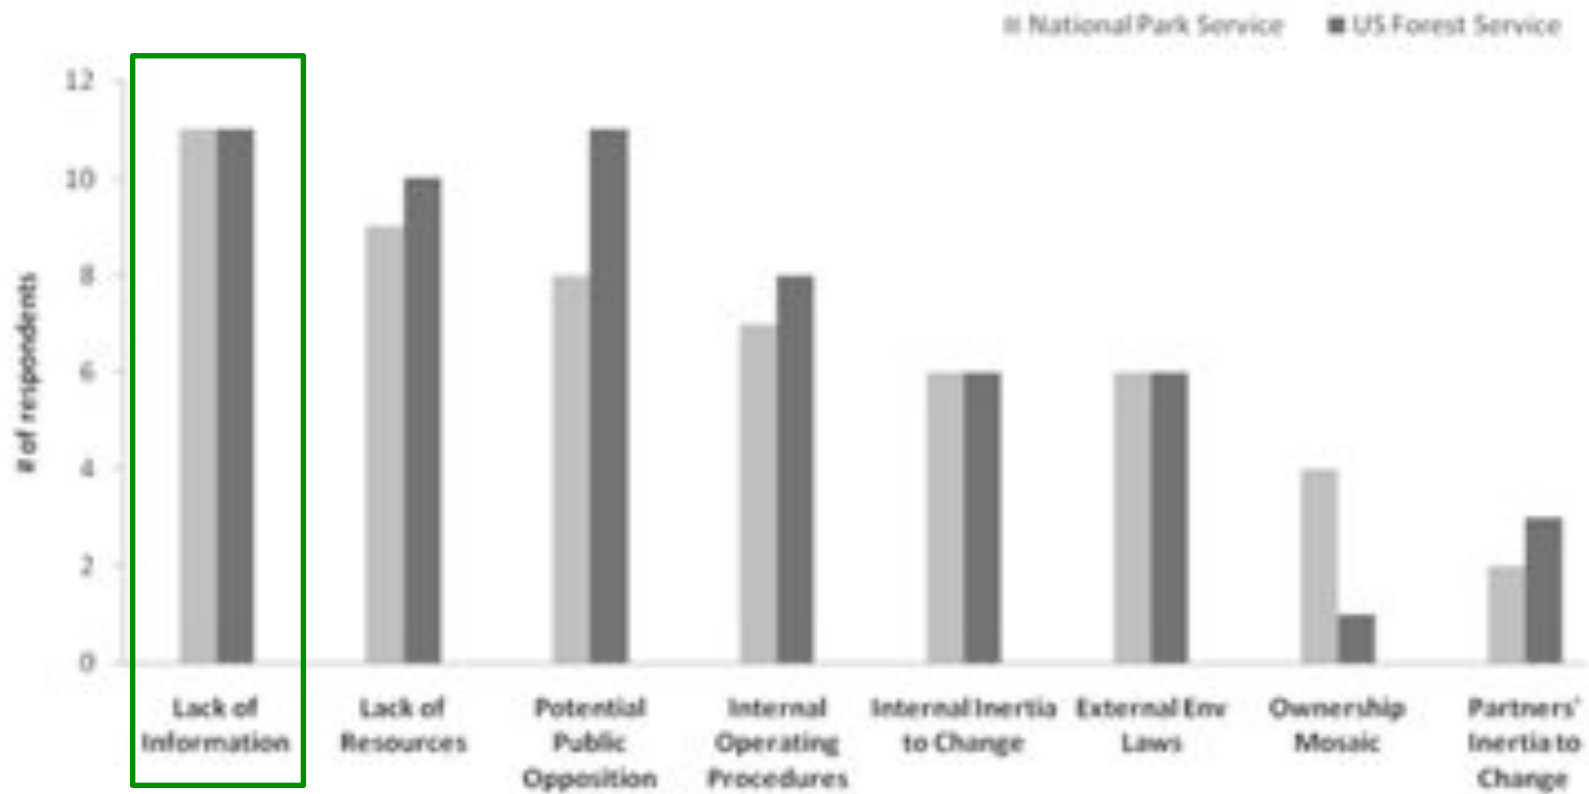

Figure 1.1. Framework for Developing Climate Change Adaptation Strategies

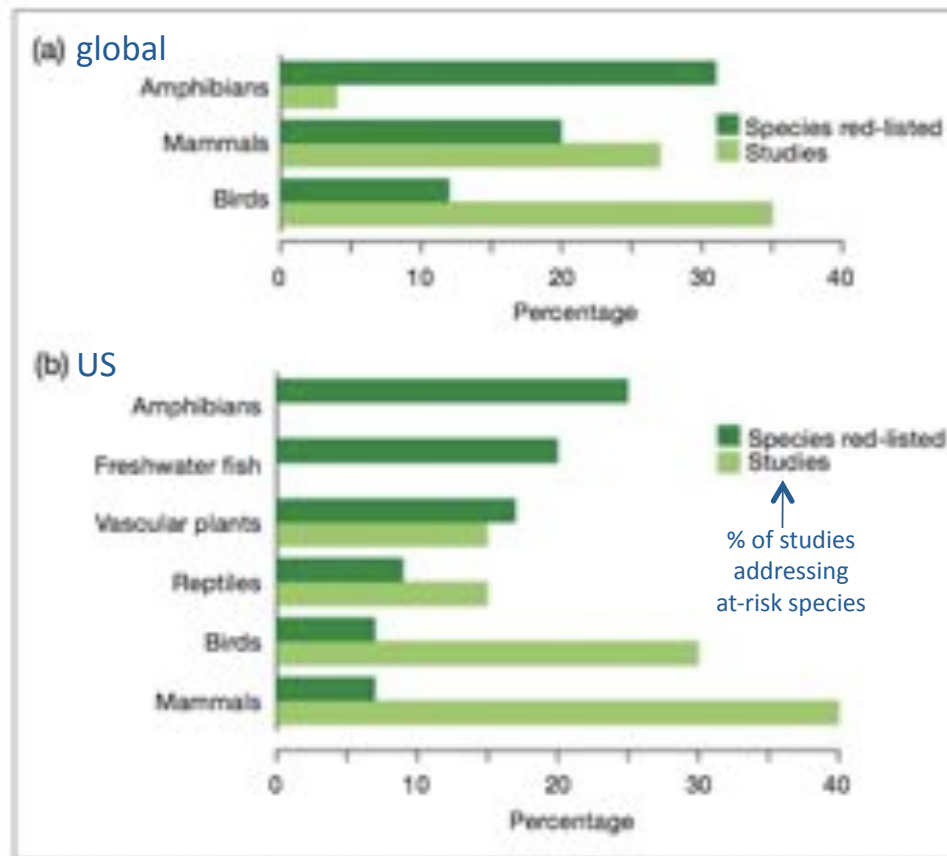

# Impediments to Climate Adaptation

# Declining amphibians + lack of information

- 31% at risk
- 11% of IUCN red-listed species
- Steepest rate of decline of any group
- Most understudied of all at-risk groups

Lawler et al. 2006. *Frontiers in Ecology and Environment* 4: 473-480.

Stuart et al. 2004. *Science* 306: 1783-1786.

Wake & Vredenburg. 2008. *PNAS* 105: 11466-11473.

# Our goals

New hydrologic products for wetlands

New methods for modeling wetland change

Wetlands symposium for scientists & managers

Wetlands vulnerability assessment (amphibian)

Identify priority landscapes for management action

# Most US Pacific Northwest mountain amphibians populations appear stable

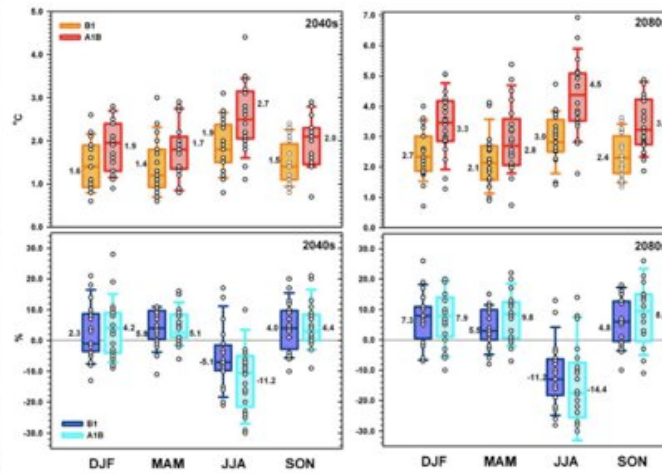

Figure C7.2. Climate change sensitivity scores for selected species on the Olympic Peninsula.

**Reduced snowpack**

**Hotter, drier summers**

**Reduced soil moisture  
& surface ponding**

Changes in **temperature** &  
**precipitation**

Changes in snowpack &  
availability of pond habitats

Changes in **temperature** &  
**precipitation**

Changes in rate & timing of  
pond inundation & drying

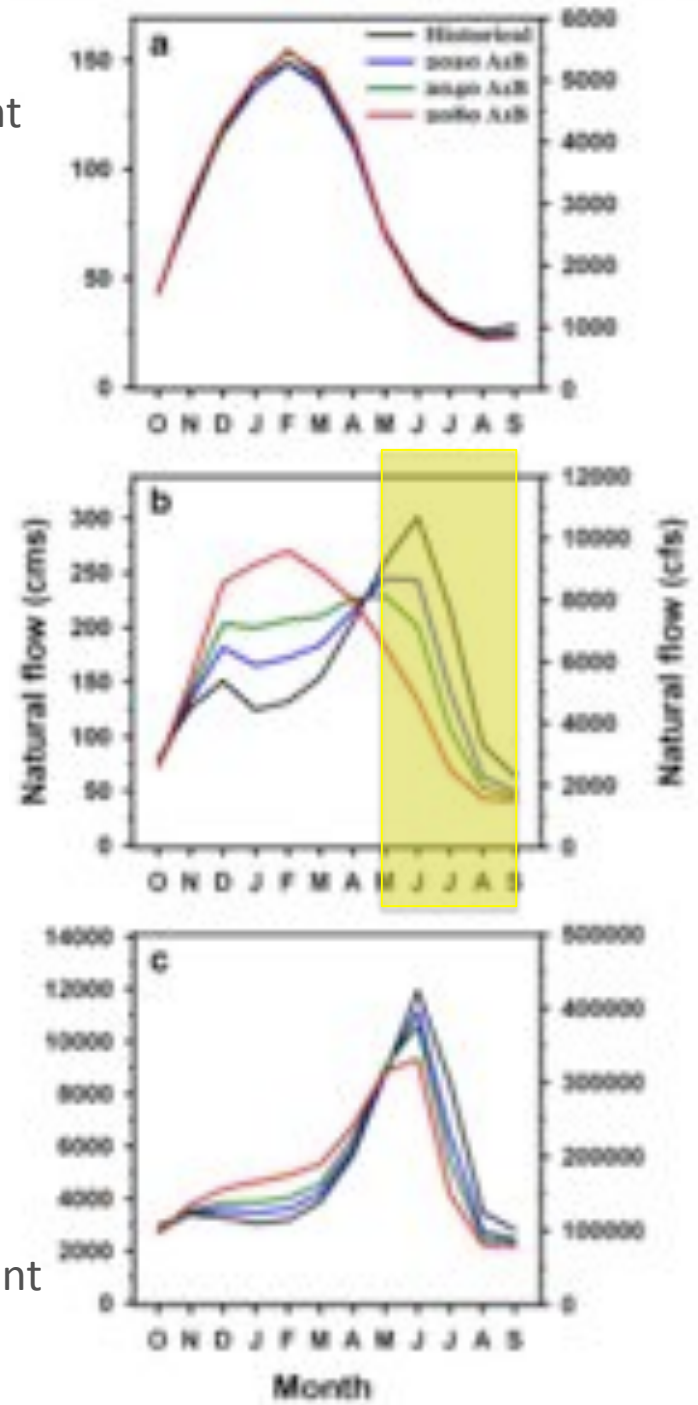

Rain-dominant

Transitional regions →

Snow-dominant

# Life history requirements vary

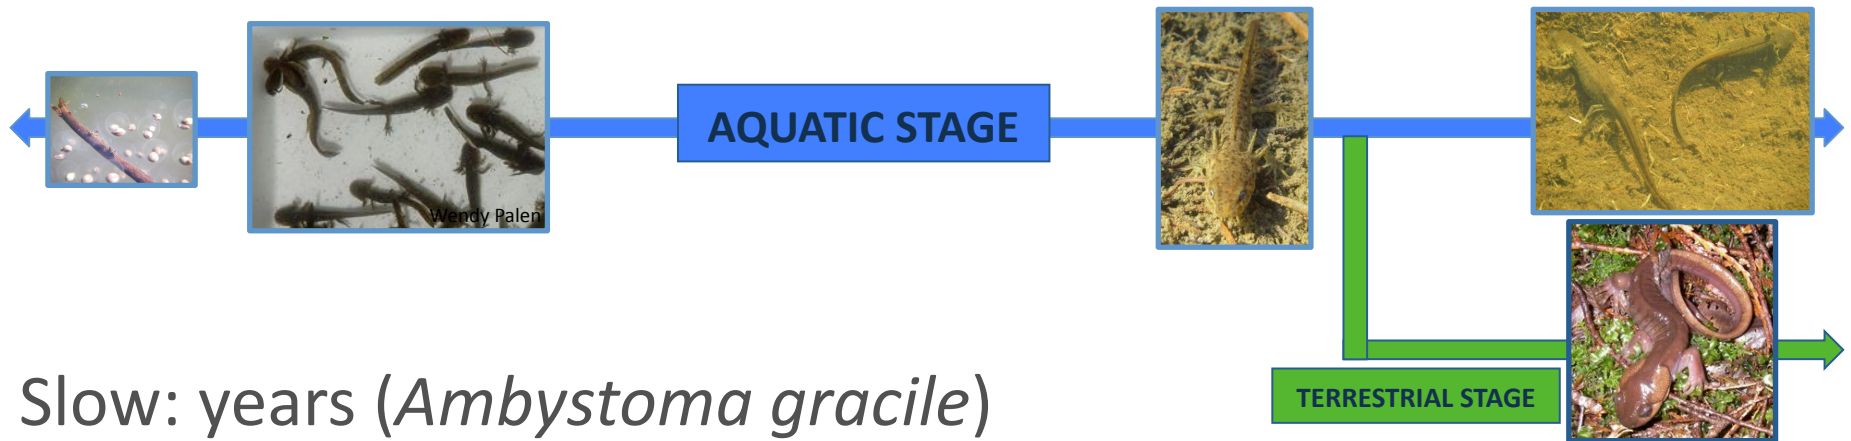

Weeks to months

Years

# Fast: months (*Rana cascadae*)

# Slow: years (*Ambystoma gracile*)

# Life history requirements vary

Weeks to months

Years

# Changing hydrology & amphibian demography

- Earlier ice-out, warmer temperatures
  - Beneficial?
    - Earlier breeding
    - Faster development
    - Longer season
    - Increased survival during mild winters

# Changing hydrology & amphibian demography

- Earlier ice-out, warmer temperatures
  - Beneficial?
    - Earlier breeding
    - Faster development
    - Longer season
    - Increased survival during mild winters
  - Detrimental?
    - Habitat loss (drying or shallow freezing)
    - Habitat compression = increased competition
    - Reduced developmental period
    - Altered life history selection
    - Decreased winter survival due to exposure

# Focal regions & field sites

- Pacific Northwest
  - Olympic Nat'l Park & Forest
    - 7 Lakes Basin
  - North Cascades Nat'l Park
  - Mt. Rainier Nat'l Park
  - Three Sisters Wilderness
  - Trinity-Alps
    - Echo Basin
- \* Hope to add Nat'l Forests

# Research plan

- Step 1: develop wetland hydrologic models for 2020s, 2040s, and 2080s
  - Alan Hamlet & Se-yeun Lee, Climate Impacts Group

# Variable Infiltration Capacity Hydrologic Model

- Fully distributed, physically based hydrologic model
- Widely used in climate change studies, including ecological studies of climate impacts
- 1/16 degree resolution (~5km x 6km)

Image: Alan Hamlet

# Research plan

- Step 1: develop wetland hydrologic models for 2020s, 2040s, and 2080s
- Step 2: remote-sensing & empirical monitoring of wetlands
  - Meghan Halabisky & Maureen Ryan, UW

Images: Meghan Halabisky

Depth transects of  
ibutton™ temperature  
dataloggers

Monitor and measure  
seasonal changes in pond  
depth & aerial extent

**Amphibian Research and Monitoring Initiative**

Use existing data & conduct  
new amphibian surveys

Continue long-term demographic studies

# Research plan

- Step 1: develop wetland hydrologic models for 2020s, 2040s, and 2080s
- Step 2: remote-sensing & empirical monitoring of wetlands
- Step 3: vulnerability assessment
  - Maureen Ryan & Meghan Halabisky, UW
  - Wendy Palen & Nick Dulvy, Simon Fraser University
  - Mike Adams, USGS Corvallis

Relate hydrologic attributes to species occupancy

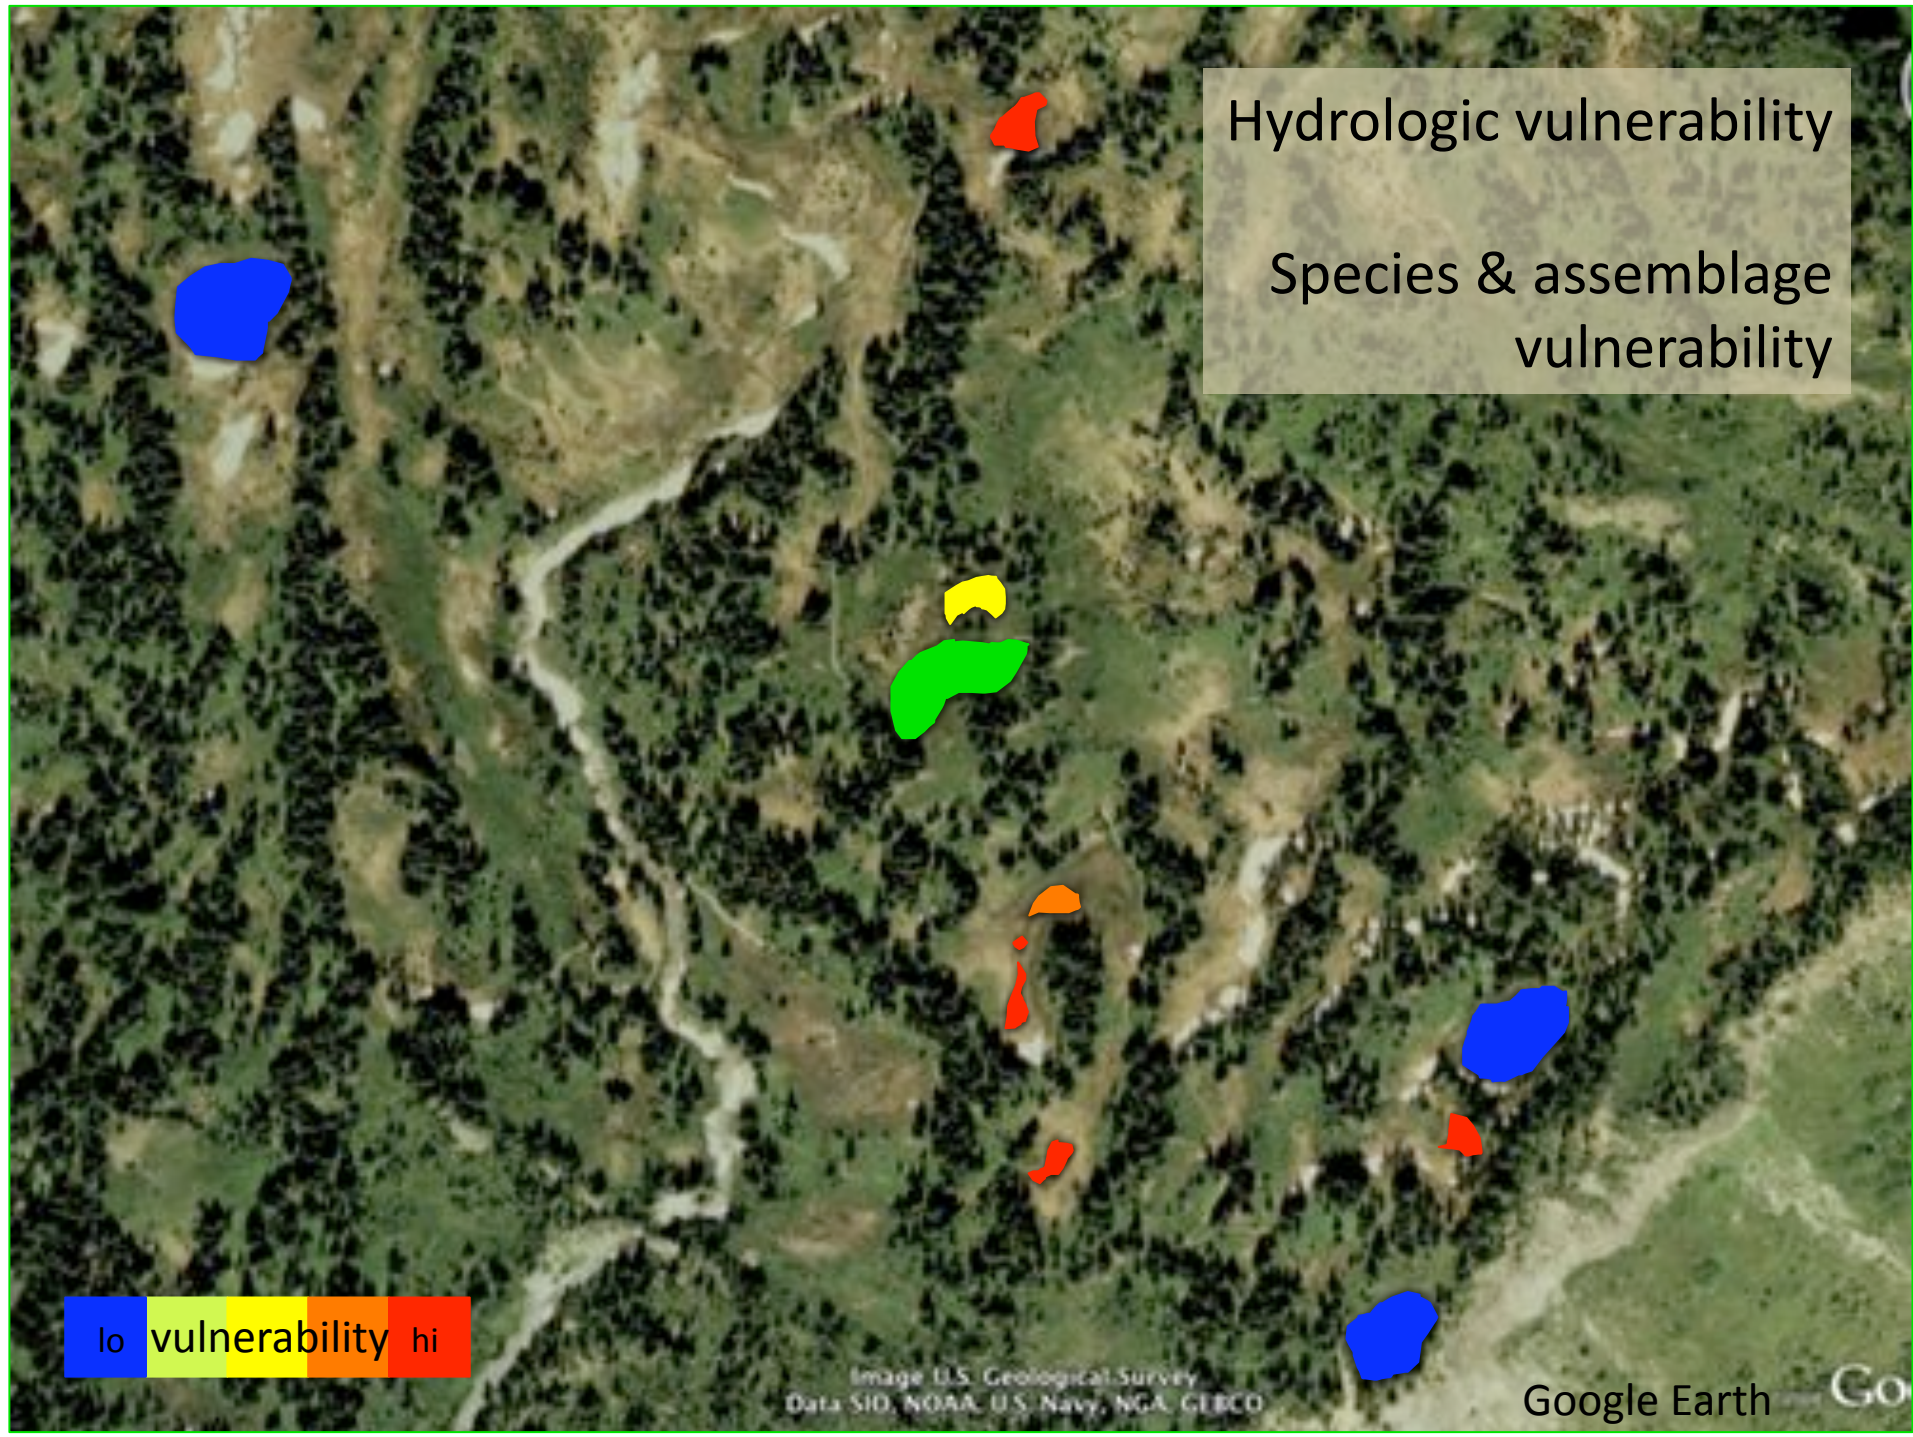

Identify hydrologic cut-offs for fast & slow life histories

# Research plan

- Step 1: develop wetland hydrologic models for 2020s, 2040s, and 2080s
- Step 2: remote-sensing & empirical monitoring of wetlands
- Step 3: vulnerability assessment
- Step 4: identify priority landscapes for climate adaptation action
  - Research team
  - NPS & USFS managers
  - Recreational stakeholder groups

# Fall 2012 Symposium

- Exchange knowledge, ideas, and feedback
- Report on progress and new resources
- Identify needs for next steps
  
- Hosted by EcoAdapt
- Invitations & request for input forthcoming
- Please forward to anyone interested
- Please attend!

# Thanks
