This study was conducted in cooperation with the U.S. Department of Transportation, Federal Highway Administration.

15. ABSTRACT

The purpose of this study is to develop a performance monitoring system for tracking the implementation of the Washington State Transportation Policy Plan. Performance monitoring is the periodic measurement of progress towards goals and objectives. A performance monitoring system uses information and action to provide a dynamic view of a program's progress. Background on the use of performance monitoring was obtained from a literature review and a survey of other state agencies. The development of indicators to track progress towards the goals in the plan was based upon interviews with key individuals involved in the creation of the goal statements. The report identifies data sources for indicators for which existing data are available and makes recommendations for filling gaps. Major findings:

- Performance monitoring can be useful for tracking progress towards goals.
- Other states have little experience monitoring transportation policy.
- Where possible, conventional indicators are recommended to track progress towards goals. In other cases less conventional indicators are required to accurately track progress towards goals.
- Existing data can be utilized, thus avoiding the need for primary data collection. This was possible for about half of the indicators. For the remaining indicators, gaps in data can be filled with local government data and the primary collection of data.

CHAPTER 1
INTRODUCTION AND APPROACH

Much criticism has been directed at public agencies for the insufficient implementation of carefully developed plans. Implementation can easily be left out when management and the general public are not aware of discrepancies between an effort's planned and actual status. Performance monitoring is a means of tracking the implementation of a plan to avoid this common planning disaster. Performance monitoring is "the periodic measurement of progress toward explicit short and long run objectives and the reporting of the results to decision makers in an attempt to improve program performance." (1)

**Performance monitoring,** in the context of the Washington State Transportation Policy Plan, can show whether the state is moving toward the 19 goals laid out in the plan. For example, one of the goals is to conserve scarce resources (the reduction of total gallons of fossil fuel consumed in the state per year). Performance monitoring would track changes in the indicators that measured whether fuel consumption was increasing or diminishing. An example of an outcome indicator is the total consumption of fuel in the state per year for transportation purposes. On the other hand, **Program monitoring** can assess whether programs designed to accomplish the goals are being implemented. For example, one program activity in the plan is to seek support for additional federal funding for freight, rail, preservation, and safety. Program monitoring would determine whether this objective was being accomplished. Indicators might measure the level of additional federal funding received by the state for this purpose.

This project emphasizes performance monitoring, as opposed to program monitoring, although some discussion of program monitoring is involved in this report.

The purpose of this project is to develop a performance monitoring system to track the implementation of the goals and policies of the Washington State Transportation Policy Plan.
This paper reports on the development of indicators useful for measuring progress toward the plan's goals.

The purpose of monitoring is to provide a feedback loop within the policy cycle. This idea is presented graphically in Figure 1.1. This diagram conveys a simplified model of the theory behind monitoring policy. Unfortunately, the process of monitoring is not so simple. External forces can counter the efforts of programs. The model of monitoring in Figure 1.2 presents a more detailed picture of the forces at work in the determination of outcomes. This framework demonstrates the dynamic nature of the world in which decisions are made and the effect of countervailing forces. This framework can be applied to the process involved in the development of outcome indicators for each of the goals discussed later in this chapter.

Figure 1.3 breaks down the project's tasks. The literature review and review of other state transportation planning agencies constitute the second and third chapters in this report. The Washington State Transportation Policy Plan and the indicator development process are discussed in the fourth chapter. The fifth chapter is devoted to the identification of data resources and their level of availability. Chapters 6 and 7 discuss the refinement and demonstration of performance monitoring indicators. Chapter 8 explores program monitoring indicators, and Chapter 9 gives conclusions and recommendations.

CHAPTER 2
LITERATURE REVIEW

DEFINITION

Performance monitoring is a subset of program evaluation. It is the most feasible and useful evaluation option. Simply put, performance monitoring is the periodic measurement of progress toward short- and long-run program goals. More specifically, it is the

"periodic observation of effectiveness and efficiency indicators in order to track the progress a program or system of programs is making in light of specific objectives. Focus is on the aggregate impact and the net effect. The mechanism is to track key indicators over time, in order to make assessments of how well programs are performing in general." (4)

"The purpose of performance monitoring is to provide relevant information to decision-makers to enable them to take appropriate action to improve program performance." (4) Relevant information can be divided into summative information, which provides information on the effectiveness of existing programs, and formative information about new programs to be developed. (5)

In contrast to performance or outcome monitoring, program monitoring focuses on program implementation and measures the direct results being produced and not whether the results are making progress toward the ultimate goals. For example, program monitoring might measure the level of service provided by a bus system, but not whether the system was ultimately achieving less dependency on the automobile. In contrast, performance monitoring focuses on the ultimate outcome rather than programmatic outputs.

Table 2.1 contrasts the different purposes of performance and program monitoring. As a reminder to the reader, the work documented in this report emphasizes performance monitoring as opposed to program monitoring. (6, 7, 8, 2)

**THEORY AND PURPOSE**

The premise underlying performance monitoring is that better information systems and control mechanisms make government more effective and better able to accomplish its goals. "A performance monitoring system is a system of information and action. It provides a dynamic view of the organization through static snapshots and is a tool to detect breakdowns. Its purpose is to provide the organization with beacon lights for steering the organization's course." (10)

Feedback from performance monitoring may lead to program modification, objective modification, more intensive evaluation, or changes in indicators. In addition, an enhanced ability to describe the current situation with facts creates more support for the plan, legal defensibility, and better development decisions. (11)

The practice of performance monitoring embodies the ideal that policy making is rational. It assumes there is a logical link between policy making and research/evaluation and that research can deliver objective facts for monitoring change.

However, the link between research and policy is not perfectly rational. Each step in the decision process is not necessarily based on an objective piece of evidence. More than a given set of goals govern policy. (10) Evaluation is a rational enterprise that takes place in a
political context. How well a program is doing may be less important than the political position of its supporters. Nevertheless, performance monitoring can clarify the trade-offs involved. (12)

**COMPONENTS OF PERFORMANCE MONITORING SYSTEMS**

The three basic components of a performance monitoring system are as follows (4):

- A data component, which provides a framework for collecting and measuring information. Data can be useless if collection is isolated from the activities and user of the information. The performance monitoring system must include continual interaction with management. The collection of data requires an agreement with management about what information is needed and agreement with personnel on what will be monitored and if it is collectible. (7)

- An analytical component, which involves comparisons of actual versus planned performance. (13)

- An action component to provide the framework for acting on information. This usually involves a determination by decision makers of whether program or policy changes are needed in light of monitoring results.
CHAPTER 3
REVIEW OF OTHER STATES

PROCEDURE

A survey of state transportation planning agencies was conducted for the American Association of State and Highway Transportation Officials/Transportation Research Board (AASHTO/TRB) conference on statewide planning held in the spring of 1989 in Boston, Massachusetts. Of the states represented, 44 responded to the survey, which provided information on the level of planning the agencies were performing. This information served as a starting point for the selection of states with the highest likelihood of having something similar to performance outcome monitoring or program monitoring under way. The presence or absence of strategic planning and the description of each state’s process was the most germane piece of information provided by the survey.

TELEPHONE INTERVIEWS

Telephone interviews were conducted with the state transportation agencies that were judged from the survey to be most likely to have some type of performance monitoring activities. These interviews determined whether they were conducting monitoring activities. More detailed information on the type of monitoring being conducted was obtained from those state agencies with monitoring programs. The states selected for the telephone interviews were as follows:

- California
- Connecticut
- Florida
- Hawaii
- Illinois
- Kentucky
- Maryland
- Michigan
- New York
- Pennsylvania
- Wisconsin
FINDINGS

Although several state agencies use program monitoring in their capital planning process, very little performance monitoring is conducted. Florida is by far the most ambitious in monitoring the performance of its transportation policy. This is consistent with Florida's commitment to growth management. Some ongoing data gathering may reveal additional states that have related performance monitoring activities. Table 3.1 summarizes the results of the telephone interviews with the 11 states selected from the AASHTO/TRB survey. The following four states are presented because they illustrate a variety of monitoring activities.

1. California. Currently, the state department of transportation in California is developing an "Executive Information System." The purpose of this system will be to monitor the implementation of projects. This will include some evaluation of the efficiency of capital outlays.

2. Florida. The Florida State Department of Transportation is in the preliminary stages of developing a performance monitoring system similar to the concept being discussed here.

The Florida Department of Transportation is currently performing several monitoring activities with the hope of developing a strategic management process. Under this strategic management process, performance monitoring would be conducted. Florida is a state with very strong state level growth management legislation. Current legislation requires all agencies to develop an agency functional plan that is consistent with requirements of the state comprehensive plan. The Florida Department of Transportation (FDOT) intends to use the Florida Transportation Plan as its agency functional plan.

The Florida Transportation Plan requires the development of a performance monitoring program, which is now in the conceptual stages.

</tr>
<tr>
<td></td>
<td>Maryland</td>
</tr>
<tr>
<td></td>
<td>Michigan</td>
</tr>
<tr>
<td></td>
<td>Wisconsin</td>
</tr>
</tbody>
</table>

3. **Maryland.** Maryland has a program similar to the one being developed in California. There is a quantitative component as part of an annual process to develop goals and policies for state transportation project expenditures. Total dollars available are set first, then distributed among projects.

4. **Pennsylvania.** Much of the literature developed on performance monitoring stems from the experience of Pennsylvania Department of Transportation. The development of a system to monitor the conditions of highways in Pennsylvania was the result of this work. This program is similar to the pavement management system in Washington state.

**GENERAL CONCLUSIONS**

- Florida is the only other state that is conducting policy performance monitoring, and Washington state is further along.
- Pennsylvania, Washington, and other states are conducting pavement performance monitoring.
- Program and project monitoring, in the context of capital planning, is more common than performance monitoring.
CHAPTER 4
THE DEVELOPMENT OF INDICATORS FOR THE
WASHINGTON STATE TRANSPORTATION POLICY PLAN

This chapter is divided into two sections: identification of goals and programs that are part of the Washington State Transportation Policy Plan, and the indicator development process. The purpose of this portion of the study was to generate a list of outcome indicators useful for tracking progress toward the goals in the Washington State Transportation Policy Plan.

GOALS AND PROGRAMS IN THE PLAN

The Washington State Transportation Policy Plan contains goals in four areas: personal mobility, economic vitality, natural environment, and institutional framework. There are 19 goals distributed among the four goal areas. The goal statements represent desired future conditions, for example, revitalized economically isolated areas. Table 4.1 lists the goals in the plan. The plan also contains related programs in four categories: working together, protecting our investments, personal mobility, and economic opportunity. The programs are activities designed to achieve the goals. Approximately 30 programs are referred to in the plan, distributed among the four program areas.

RELATIONSHIPS BETWEEN GOALS AND PROGRAMS

To aid understanding of the scope of the plan, matrices have been prepared to illustrate the relationships between the goals and programs within the plan (see Appendix A). The matrices are useful to

- provide a "map" of the plan for reference,
- indicate which goals are well supported with program activities and which goals suffer from little or no program support,

</tbody>
</table>
• indicate which programs are supportive of several goals and which programs are completely unrelated to the goals within the plan,
• provide an overall gauge of how well the programs and the goals are coordinated, and
• indicate the level of implementation for each of the programs.

A glance at the matrices (Appendix A) shows the goals that have significant program support within the plan and those with little to no support. It is important to note that other programs not discussed in the plan also support the goals; however, these were not reviewed for this report. The level of program support for each goal is summarized in Table 4.2. Support is measured by the number of programs in progress that help to fulfill the goal. The table shows how the majority of goals have moderate or extensive program support, although three goals have no program support in the plan.

**INDICATOR DEVELOPMENT**

**The Interview Process**

To establish a set of indicators that can measure progress toward the goals it is important to understand what the goals in the Washington State Transportation Policy Plan mean and the concerns that underlie them. This allows the selection of indicators that are relevant to policy discussions.

Interviews were conducted with key individuals involved in the development of the plan's goals. The Washington State Transportation Policy Plan is directed by a steering committee composed of professionals who represent several agencies, in addition to the Washington State Department of Transportation. The goals of the plan were developed by the Desired Futures Conditions Subcommittee. To develop indications for tracking progress toward the goals in the plan, members of the Desired Future Conditions Subcommittee, in addition to other members of the steering committee, were interviewed.

<td></td>
</tr>
</tbody>
</table>
The interviews consisted of questions intended to document the process by which the goal was established, gain information on potential measures to monitor progress, and gain references to data sources to monitor recommended indicators.

**Indicators for Performance Monitoring**

After these discussions, the researchers identified the major legislative concerns associated with each goal and developed related performance measures. The idea was to identify a limited number of indicators that were simple to understand by the general public and based as much as possible on existing data sources. More complex indicators could provide useful information for policy discussions. However, simple indicators would ease the introduction of performance monitoring for transportation policy. A set of 42 indicators was developed for the plan’s 19 goal statements. The list of indicators is located in Table 4.3. In this table, the indicators are associated with the goals they are intended to monitor. (See Appendix B for more detailed information about the indicator development process.) Information more qualitative in nature obtained in the interviews is presented in the issues and concerns section of Appendix B.

An example of the process used in the development of the indicators can be illustrated with the goal of linking land use development directly with transportation development. The issues and concerns underpinning this goal concern quality of life and efficiency of movement within the urban environment. On the basis of these concerns, the researchers identified four indicators that could measure progress towards the transportation and land use development goal:

- percentage of modal split,
- average travel time between specified locations,
- average trip length, and
- number of dwelling units and employees per acre.

                                                                                     - # of programs that promote public participation |
| 17) facilitate interjurisdictional and regional coordination                  | - # of Regional Transportation Planning Organizations (RTPOs) formed  
                                                                                     - # of projects successfully built by Transportation Improvement Bureau with regional cooperation  
                                                                                     - # of interlocal agreements |
| 18) assure the preservation of the needed system                              | - % of existing highway system at an acceptable standard of repair  
                                                                                     - % of existing railroad system at an acceptable level of repair  
                                                                                     - dollar value of deferred maintenance of transit facilities |
| 19) sponsor innovative research and development in cooperation with academia, private sector and others in order to identify new cost effective methods and address current and future transportation needs | - % of annual transportation budget devoted to research  
                                                                                     - $ devoted to innovative research and development |
These four indicators are fairly well known by the professional community and can be understood by the general public.

A similar process was followed for each of the 19 goals in the Washington State Transportation Policy Plan. For nine of the goals, reasonably conventional indicators were found. However, for ten of the goals, there were fewer conventions on which to base the indicators, and it will be more difficult to obtain agreement on the best indicators to use. Table 4.4 lists the goals according to whether the indicators that are available to track them are more or less conventional.

Once appropriate indicators have been selected, additional work will be needed to refine them. For each indicator the following additional details will need to be resolved:

- The appropriate geographic unit of measurement. For example, should the results be reported statewide, by county, or on a city by city basis?
- The definition of terms. For example, which modes are included in the modal split analysis?
- The frequency of measurement. Should information be collected every one, two, five, or ten years?
- The best units of measurement. For example, should density be measured in terms of persons or dwellings per square mile?
### Table 4.4. How Conventional are the Recommended Indicators for Each Goal?

CHAPTER 5
THE IDENTIFICATION OF DATA SOURCES

Once recommended indicators have been identified, the researchers investigated whether the information they would require is available. The assessment focused on data sources presently or soon to be available at the state level. The information was primarily collected through staff members in state agencies, with some help from local agency staff.

During the process of investigating available data sources, some adjustments were made to the list of indicators. While not allowing indicators to diverge too far from their original objective, the researchers sought to make the best use of existing data.

For each goal, the availability of data to track the related indicators was determined. For example, the indicator developed to monitor the safety component of the goal to provide safe, reliable, convenient access is the number of accidents per million miles travelled. The Traffic Safety Commission's annual report is statewide and provides the data required. The results for all the goals are summarized in Table 5.1. Appendix C lists the actual data sources found for each indicator.

Three levels of data availability were found:

1. (All) – goals for which most or all of the needed data are available at the state level.
2. (Some) – goals for which some of the needed data are available at the state level.
3. (None) – goals for which little or none of the needed data are available at the state level.

For the 42 indicators, the researchers found all data for 20, some data for 5, and no data for 17.

Data are available to track at least some or all the indicators for most of the goals. However, for four goals, little or no data are available.

The shortage of data raises doubts about the current ability to fully monitor progress toward all the goals in the Washington State Transportation Policy Plan. However, the data are sufficient to begin monitoring most of the goals in the plan.

**STRATEGIES FOR FILLING THE DATA GAPS**

Strategies for filling the data gaps identified in the previous section are presented in Appendix C. The strategies fall into two categories: gathering data that are already held by local governments or that could be easily collected as part of their routine operations and wholly new data collection efforts. The recommended strategies for filling the gaps are summarized in
Table 5.2, which lists the goals according to whether one or the other or both of these strategies are needed to provide the data necessary for their indicators.\(^1\)

Overall, current data gaps can be filled. In several instances this will require primary data collection efforts. However, in other areas, data gaps can be more easily filled by surveys of local governments to gather the information they already have or could easily obtain as part of their routine activities.

\(^1\)Local governments were not surveyed for this report and assumptions were made about their capabilities. The comments made here about local government data sources should be read with this caution in mind.
CHAPTER 6
COMMENTS ON INDICATORS AND FURTHER REFINEMENT

This portion of the study obtained feedback from key individuals involved in the development of the initial indicators (see Table 4.3) and refined the indicators based on their comments. The indicators in Phase I were developed after interviews with key individuals responsible for the creation of the goals in the plan (see Table 4.1). The majority of those interviewed were members of the Desired Future Conditions Subcommittee of the Washington State Transportation Policy Plan Steering Committee. This subcommittee was charged with the development of goals for the Washington State Transportation Policy Plan.

The respondents were asked whether the indicators listed in Table 4.3 were accurate measures of progress toward the goals. If they felt they were inaccurate, an alternative indicator was requested. They also were asked which goals should be selected to further demonstrate the feasibility of performance monitoring. Responses were received from five individuals. They are presented in Appendix E. In general, the following comments were made on the accuracy and quality of the recommended indicators:

1. Make the indicators simple where possible.
2. Keep them directly linked to transportation.
3. More thought will be needed to develop meaningful indicators in some of the newer areas such as urban design.
4. It is essential that indicators be quantifiable where possible.

In response to these comments, new indicators were generated. The initial list of indicators (from Table 4.3) and a refined list are presented in Table 6.1.

CHAPTER 7
FURTHER DEMONSTRATION OF SELECTED GOALS

Five goals were selected for further testing to more rigorously demonstrate the feasibility of performance monitoring. The objective was to thoroughly assess the data requirements for the indicators of the selected goals and to present historical baseline data for the indicators in graphic form where possible to illustrate how an actual monitoring report might look.

Five goals were selected that were representative of the range of issues involved in the implementation of performance monitoring. This enabled the analysis to be generalized to the other goals that were not selected for detailed study. Four criteria were used to make the selection, including the recommendations of the survey respondents (see Chapter 6), the availability of existing data for the indicators, the quantifiability of the indicators, and the geographic scale at which progress would be monitored. Survey response scores and ratings for the other criteria are displayed in Table 7.1. Five goals were selected that together covered the range of scores given for the criteria and were of high priority to the survey respondents. The goals that were selected are indicated in Table 7.1.

Indicator Data Assessment Forms were used to compile information on the quality of data available. Information on the data was based on extensive investigations into data sources and interviews with state and regional agency staff. The indicator assessment forms are located in Appendix E.

Each proposed indicator was assigned an ordinal, level of effort score based on the nature of work that would be required to make the indicator fully operational. The criteria for each level of effort are given in Table 7.2. The selected goals, proposed indicators, and associated level of effort are graphically displayed in Table 7.3.
The level of effort measures can be grouped into three categories:

- data available at the state level,
- data available at the local level, and
- primary collection of data required.

The distribution of indicators among these three categories is displayed in Table 7.4. Of the 19 indicators recommended for the five goals, sufficient data were available to construct historical baseline trends for 15 percent (3) of the indicators, which are presented in Figures 7.1 to 7.3. However, with limited effort in reformatting and calculating, 42 percent (8) of the indicators could be made fully operational with data that are already collected at the state level. Primary data collection would be required for approximately 37 percent (7) of the indicators by methods that are already known or need to be developed. This would require a significant commitment of resources. The remaining 21 percent (4) of the indicators could be made operational with data that are collected at the local or regional level. This suggests that progress toward many aspects of the policy plan's goals can be monitored at this time. However, many other aspects of the goals cannot be monitored without additional data analysis or collection. Unless these efforts are made, planners and policy makers will be unable to fully monitor or guide progress toward the goals of the policy plan.

CHAPTER 8
TOWARD PROGRAM MONITORING

The purpose of this chapter is to explore the issues associated with program monitoring and the feasibility of program monitoring for the Washington State Transportation Policy Plan. Most of this report has focused on performance monitoring, or measuring progress toward the 19 stated goals in the Washington State Transportation Policy Plan. However, as noted in Chapter 1, a variety of public agency programs are the primary vehicles used to achieve planning goals. In fact, if programs designed to reach planning goals are not effectively implemented, those goals probably will not be achieved. Therefore, in addition to performance monitoring, program monitoring is an important source of quantitative and qualitative information on the implementation of adopted plans. According to one author, "programs should be monitored to ascertain their compliance with (or deviation from) stated goals, responsible expenditures of allocated funds, and detection of problems before they mushroom into crisis."(14)

As noted in Table 2.1 above, program monitoring activities focus on program objectives and program products rather than ultimate goals. This distinction is important. While programs should contribute toward ultimate goals, they are seldom the only factors involved in attaining them. For example, a program to expand transit service clearly contributes to the goal of increased transit accessibility. However, accessibility itself is affected by much more than just the level of transit service. By definition, program monitoring would aim to measure the specific level of transit service provided by a transit program, while performance monitoring would focus on several measures of accessibility (and other goals) furthered by the transit program.
PROGRAM MONITORING ISSUES

A significant issue with program monitoring is the institutional and organizational relationship between the planning entity that sets goals and objectives and the program managers that oversee their implementation. Most programs that help carry out plans are not under the direct authority of a single planning entity. The Washington State Department of Transportation (WSDOT), for example, is responsible for only a few of the many programs that assist the implementation of the state Policy Plan goals. The state Transportation Policy Plan, a process sponsored by the STC, does not have the statutory responsibility or resources to monitor other departmental and agency program implementation activities in any great detail, with the possible exception of the WSDOT.

Another important issue concerns the preferred criteria that will be used to monitor programs. Program managers tend to see the objectives and performance of their programs differently from the the eyes of an "external" evaluator. Resistance may be high to proposed measurements of their programs against output or productivity standards developed by others, e.g., the state Transportation Commission's state Policy Plan.

A third issue is critical: who does the monitoring? External monitors can be perceived as auditors and as threatening to the autonomy and funding security of a program. On the other hand, self-reporting of program performance often lends itself to inaccurate results. Overall, the business of program monitoring can be threatening to program managers and can generate or escalate interdepartmental and interagency conflicts.

Ultimately, the success of the Policy Plan will depend on the effective implementation of many diverse programs across different organizations to achieve its goals. Some form of performance evaluation structure is needed to enable the state Transportation Commission to know whether these programs are successfully achieving Policy Plan objectives over time.
PROGRAM MONITORING DATA

Project staff developed a data matrix to organize useful program monitoring information. The matrix is displayed in Appendix F. Programmatic Action Strategies are displayed across the top of the matrix. Information useful for program monitoring is provided for each action strategy.

Level of Program Implementation

Many of the action strategies in the Policy Plan require legislative action to be implemented. Therefore, one kind of information worth collecting is whether legislation exists to support the strategy, or legislative efforts are under way on pending legislation, or no legislative efforts are under way.

Institutions Involved in the Strategy

Information was obtained from the Policy Plan's "Preliminary Implementation Plan" (1990) on the agencies involved in the implementation of each programmatic action strategy. For example, the programmatic action strategy "Define and develop a system of heliports to serve state needs" has WSDOT listed as the only institution involved, while other strategies rely on the cooperation of several state and/or local agencies.

Program Inputs

An indicator was developed to measure the amount of resources that are or may be devoted to a program. The indicator is usually dollars. For example, the programmatic action strategy, "Define the state's role in transportation planning" has been assigned an input indicator: $ devoted to defining the state's role.

Program Outputs

An indicator was developed to measure the products or results of each program. For example, the programmatic action strategy, "Pass enabling legislation to establish a regional transportation planning process" has been assigned an output indicator: has legislation been passed.
Program Quality

The quantity of outputs generated by a program may be the same in two instances, but the quality of the outputs may vary between instances. Therefore, an indicator was developed to measure the quality of a given program. This assessment usually requires the opinions of peers or a panel review. For example, the programmatic action strategy, "Update the 1985 ports and transportation system study" has been assigned the quality measurement: comprehensiveness of update. The comprehensiveness would need to be assessed by a designated peer group.

Institutions With Related Programs

Institutions with other programs that involve related activities are listed to encourage coordination. If efforts can be coordinated between programs with similar missions, then greater efficiency will result.

FUTURE WORK

Once program monitoring data have been collected, various analyses can be conducted to learn more about the programs and their effectiveness. For example, when inputs and outputs are compared over time, changes in the cost-effectiveness or efficiency of programs can be determined. In addition, studies can be conducted to compare program outputs to changes in performance measures of progress toward goals so that the contribution made by the program to progress toward the goal can be identified. This kind of program evaluation study would assist the Transportation Commission to determine which programs are most important for accomplishing Policy Plan goals.
CHAPTER 9
MAJOR FINDINGS AND FUTURE WORK

MAJOR FINDINGS

- Performance monitoring can be applied to transportation policy to track progress towards planning goals.
- Other states have little experience with performance monitoring in transportation policy, but the state of Florida is working to build a performance monitoring system.
- Conventional indicators can be used to track progress towards approximately half of the goals in the Washington State Transportation Policy Plan. Less conventional indicators will be required for the other goals.
- Data needed to track changes in about half the indicators are currently available. For the other indicators, data gaps can be filled through data collection from local governments and new data collection efforts.
- Environmental factors such as economics, politics, and technology influence the nature and extent of policy implementation.

FUTURE WORK

The following steps are recommended to help establish a permanent performance monitoring system for the state Transportation Policy Plan.

1. Amend the Policy Plan to make monitoring a formal program objective.
2. Have the Transportation Commission establish a protocol and information system within the WSDOT planning office to maintain data on the performance indicators. Assign staff responsibilities for monitoring.
3. Develop formal understandings with other state agencies that already maintain needed data. These include at a minimum the Department of Community Development, the Department of Ecology, the Office of Financial Management,

4. Collect data and where necessary calculate measurements for historic baseline conditions for those indicators that rely on existing data available at the state level. These may include the following indicators:

- Number of accidents per-million VMT
- Total cost of moving goods per ton-mile
- Total cost per person-mile of travel
- Population density in cities
- Employment density in cities
- Jobs/housing balance in cities
- Annual public investments ($) in port facilities and services
- Dollar value ($) of transportation investments in distressed areas
- Average fuel consumption per mile
- Amount of air pollutants attributable to vehicles
- Presence/absence of policy that discourages joint development
- Presence/absence of policy that encourages joint development
- Number of jointly development transportation projects
- Number of transportation projects with shared personnel
- Dollar value of technical assistance to local government
- Percentage of district budgets devoted to public information/participation activities
- Number of RTPOs formed
- Number of projects built by TIB with regions
- Number of regionally significant projects completed versus programmed
- Pavement condition index
- Number of rail miles abandoned per year
- Operational hours of ferry service per capita
- Percentage of transportation budget for research
- Dollars devoted to innovative R & D

5. Develop and implement procedures and establish formal agreements for collecting data available at the regional or local level. These include at a minimum Regional Transportation Planning Organizations and local transit agencies. These agreements should address data for the following indicators:
  - Variability in travel time between locations
  - Average trip duration between locations
  - Percentage of transit vehicles/stops that are handicapped accessible
  - Consistency between land use and transportation plans
  - Percentage of population living/working within 1/4 mile of transit service
  - Acres of resource lands designated under the Growth Management Act lost by transportation development
  - Acres of sensitive areas designated under the Growth Management Act lost by transportation development
  - Percentage of intermodal linkages with all weather designs
  - Amount of revenue generated to support a mode/amount of revenue required
  - Yearly transit passengers per capita
  - Operational hours of transit per capita

6. Conduct research toward the development of indicators in those areas where more fundamental work is needed. These include the areas of urban design, land use, consistency, and concurrency.
7. Develop and implement procedures for collecting primary data that are currently not collected statewide. This includes data for the following indicators:
   - Variability in travel time between locations
   - Trip duration between locations
   - Consistency between land use and transportation plans
   - Pollutant mix in water runoff from highways
   - Number of people exposed to greater than 70 CNEL due to the transportation system
   - Visual Quality Index rating along state highways

8. Develop long-term targets and 5-year benchmarks as a means of predicting and evaluating progress toward the goals in the plan. This should be based on a study of historical trends, desired future conditions, and the likely progress that can be made toward the desired future conditions.

9. Develop and implement a program monitoring system. For each program this process should include the following:
   - the establishment of a lead agency;
   - the establishment of the authority to monitor between agencies;
   - the establishment of a peer review system to assess program quality;
   - coordination of efforts among other institutions with similar programs;
   - the development of an appropriate schedule for data collection for each program's input and output indicators.

10. Evaluate the relationships between programs and progress toward goals through a comparison of performance indicator data from locations with different levels of program activity. For example, the goal "to revitalize economically distressed areas" would be supported by the following proposed program: "establish a
special account to fund transportation projects in economically distressed areas of the state."

The following indicators are proposed to monitor progress toward this goal:

- average household income in distressed areas;
- number of jobs per unit of area in distressed areas;
- unemployment rates measured in distressed areas.

The program's relationship to progress toward the goal can be tested by comparing data collected for these three indicators in similar locations that do and do not have support from this program.

### GOAL AREAS

#### Personal Mobility
- To provide safe, reliable, and convenient access to employment, educational, recreational, opportunities in order to reinforce a sense of community statewide.

#### Economic Vitality
- Providing cost effective accessibility for goods.
- Providing cost effective accessibility for people.
- Linking land-use development directly with transportation system development.
- Supporting international trade.
- Revitalizing blighted urban areas.
- Revitalizing economically isolated areas.

#### Natural Environment
- Conserve scarce resources.
- Reduce pollutants and other wastes from trans. system.

Note: Refer to list of abbreviations located at the front of the appendices.
APPENDIX D

SURVEY RESULTS FROM INDICATOR
REFINEMENT PROCESS
APPENDIX D
SURVEY RESULTS FROM INDICATOR REFINEMENT PROCESS

I. General Comments on Preliminary Indicators

RESPONDENT #1 (A Metropolitan Planning Organization (MPO)):

Recommends approaching the indicators in a more simplistic manner for statewide monitoring and applying more specific and complex measures to the metropolitan areas. The setting of performance objectives is also recommended prior to the development of indicators.

Rank Order of Goals — no rank order was indicated

RESPONDENT #2 (Washington State Department of Transportation):

Indicators need to be transportation related, as with the case of blighted/distressed urban areas. Questions how urban design goal indicators will be implemented; are they nominal, etc.

Rank Order of Goals

- #1 safe, reliable, convenient access
- #2 preservation of needed system
- #3 reduce pollutants
- #4 ensure collection of appropriate revenue
- #5 link land use development with transportation development

RESPONDENT #3 (University of Washington Professor):

The indicators developed to monitor the goal to link land use planning with transportation planning will serve as a "start," meaning that more thought is required to develop meaningful indicators. We need to link blighted/distressed urban area goal indicators with transportation investment. Collection of appropriate revenue indicators need to assess specific modes to be meaningful. In addition, the qualitative indicators such as those developed to measure citizen participation are not good measures.

Rank Order of Goals

- #1 link land use development with transportation development
- #2 include effective urban design in transportation facilities
- #3 ensure the collection of appropriate revenue
- #4 ensure the preservation of the needed system
- #5 reduce pollutants

RESPONDENT #4 (Washington State Department of Transportation):

Feedback pertaining to the goal to provide safe, reliable, convenient access was particularly useful. The location of monitoring stations to determine travel time
needs to take into account total trip time not just the link. This is somewhat confusing and may not be practical. Good ideas for indicators of the urban design goal were provided.

Rank Order of Goals

- #1 assure the preservation of the needed system
- #2 provide cost effective accessibility for goods
- #3 link land use planning with transportation planning
- #4 safe, reliable, convenient access
- #5 reduce pollutants

RESPONDENT #5 (Washington State Transportation Commission):

Particular areas of concern are that we be sensitive to issues that are statewide and pertinent to non-Puget sound residents. In addition, attempting to create quantifiable, measurable indicators is essential. Sensitivity to political issues and transportation relatedness were concerns as well.

Rank Order of Goals — none indicated

II. Indicators in Detail

Goal #1 — Provide safe, reliable, convenient access

Comments:
- safety; use number of accidents (as opposed to incidents) per million of vehicle miles travelled (MPO, WSDOT)
- reliability; locations for monitoring must be for total trip not just link (WSDOT)
- convenience; locations for monitoring must be for total trip not just link (WSDOT)

Alternatives:
- population of state/miles of primary and interstate route (MPO)
- population of state/miles of intercity bus service (MPO)

Goal #2 — Provide cost effective accessibility for goods

Comments:
- total costs does not necessarily indicate cost effective; assess alternative costs/mode (University of Washington)
- accurate if all modes are combined (WSDOT)

Alternatives:
- total cost per ton-mile (MPO)
- alternative: investment/goods moved (WSDOT)
Goal #3 — *Provide cost effective accessibility for people*

**Comment:**
- indicator needs to relate to goal; assess costs and transportation alternatives (University of Washington)

**Alternatives:**
- investment/people moved system wide and site specific (WSDOT)
- cost per person-mile of travel (MPO)

Goal #4 — *Link land use planning directly with transportation planning*

**Comments:**
- indicators provided are a superficial measurement. It does not mean that they are doing it. (WSDOT)
- number of RTPs functioning (Transportation Commission)

**Alternative:**
- number of RTPs in compliance with regional development strategy requirement of state planning standards (MPO)

Goal #5 — *Link land use development directly with transportation development*

**Comment:**
- differentiate between within Puget Sound and east versus west (Transportation Commission)

**Alternatives:**
- percentage of population near transit (WSDOT)
- concurrency compliance (WSDOT)
- level of service on links (WSDOT)
- number of building permits approved meeting concurrency requirements divided by total building permits submitted (MPO)

Goal #6 — *Support international trade*

**Comments:**
- indicator may miss exports from eastern Washington that go via Columbia River
- need to distinguish between value of goods and value of transportation services (University of Washington)

**Alternatives:**
- dollar value of transportation related development (MPO)
- percentage of freight moved by mode (WSDOT)
Goal #7 — Revitalize blighted urban areas

Comments: • the indicators developed are not sufficiently transportation related (Transportation Commission, WSDOT, University of Washington)

Alternatives: • average housing price/average salary # of housing rehabs
• dollar value of transportation related development (MPO)

Goal #8 — Revitalize economically isolated areas

Comments: • indicator needs to be more transportation related (University of Washington)
  • maybe for ongoing monitoring of where the areas are — not useful beyond that (WSDOT)

Alternative: • number of new jobs created a result of transportation improvements

Goal #9 — Conserve scarce resources

Comments: • although already indicated; measures need to deal separately with passenger and freight (Transportation Commission)
  • compare to potential (University of Washington)

Alternatives: • average fleet fuel efficiency in MPG (WSDOT)
  • ton-mile per unit moved for freight (Transportation Commission)
  • passenger-mile per passenger moved (McKibbon)
Goal #10 — Reduce pollutants

**AIR:**
- relate directly to fuel consumption (WSDOT)
- when using number of days in violation of EPA standards as an indicator there are too many other variables affecting measure (WSDOT)

**WATER:**
- need to focus on effectiveness of treatment system (WSDOT)
- expand measure to include a water quality analysis (WSDOT)

**NOISE:**
- use a given DHB level not "unhealthy" as opposed to using a level using unhealthy in indicator (WSDOT)
- measure of unhealthy level should be that which is greater than 70dba (MPO)

**Alternative:**
- number of miles of highways that are noise generators (expose people to excessive noise) (WSDOT)

Goal #11 — Avoid the disruption and degradation of historically and environmentally significant locations

**Comments:**
- with regard to environmentally sensitive habitat, indicator is irrelevant due to "No net loss legislation" (WSDOT)

- need to specify classes as found in state wetlands act (Transportation Commission)

- with regard to historically significant locations, it is possible to also monitor those locations positively affected by transportation system development (University of Washington)

- "adversely affected" as used in the historical indicator is too subjective (WSDOT)
Goal #12 — Include effective urban design in transportation facilities

Comments: • the indicators developed will all be useless unless they are carefully operationalized. For example, "Presence or absence of pedestrian amenities at transit nodes." How is this measured — standards must be developed for the collection of data. (WSDOT)

• the indicator (percentage of highway system with landscape treatment and buffering) is foolish (WSDOT)

• confusion over the indicators ask for a yes or no or to some degree (WSDOT)

• the indicator: (percentage of highway system with landscape treatment and buffering) is not applicable in eastern Washington (Transportation Commission)

Alternatives: • all weather intermodal linkages (WSDOT)

• sidewalks/highways as a percentage of the total highway system (WSDOT)

• roadmiles of urban corridors revitalized through urban design and access control (WSDOT)

Goal #13 — Ensure the collection of appropriate revenues to support the transportation system

Comments: • indicator should be the amount of revenue required as opposed to the amount of revenue available to support the transportation system in the numerator (Transportation Commission)

• concern over how predictable the indicator developed will be (Transportation Commission)

• need to assess the modes within the transportation system — money available for one mode is not necessarily "trans" (University of Washington)

Alternative: • needs/revenue ratio (WSDOT)

Goal #14 — Encourage opportunities for public/private partnerships

Comments: • good indicators developed (Transportation Commission)

• accurate measure checked by all respondents
Goal #15 — Promote greater sharing and coordination of technical expertise

Comment:  • indicator calling for the number of technical applied manuals produced in and disseminated by the state is too bureaucratic (Transportation Commission)

Alternative:  • dollar value of technical assistance to local governments

Goal #16 — Promote sensitivity to public participation

Comments:  • regarding the indicator (percentage of citizens surveyed who feel they have opportunities for participation), if constituencies have a problem they will speak up. (WSDOT)

• regarding the indicator (number of programs that promote public participation), this information is hard to obtain on a statewide level. (WSDOT)

Alternative:  • percentage of district budget devoted to public information activities (WSDOT)

Goal #17 — Facilitate interjurisdictional and regional coordination

Comment:  • Is the indicator, "# of interlocal agreements" a bureaucracy measure? (WSDOT)

Alternative:  • number of regionally significant transportation projects completed versus programmed (MPO)

Goal #18 — Assure the preservation of the needed system

Comments:  • the indicators as separated by mode are a good idea but questions over whether they can be implemented are raised (WSDOT)

• dollar value of deferred maintenance is hard to obtain for transit facilities (WSDOT)

Alternatives:  • percentage of miles of abandoned railroad lines (WSDOT)

• ferry system deferred maintenance (WSDOT)

Goal #19 — Sponsor innovative research

Comments:  • none
APPENDIX E

INDICATOR DATA ASSESSMENT FORMS

The Indicator Data Assessment Forms are comprised of seven sections:

<table>
<thead>
<tr>
<th>CATEGORY</th>
<th>DATA</th>
</tr>
</thead>
<tbody>
<tr>
<td>I. Proposed Indicator (as per data source)</td>
<td>This is the indicator that was developed in response to the availability of existing data, further research and interviews with subject experts.</td>
</tr>
<tr>
<td>II. Explanation of Proposed Indicator</td>
<td>This statement describes how the indicator applies to the goal statement.</td>
</tr>
<tr>
<td>III. Current Data Availability</td>
<td>This section applies to those indicators for which there is existing data. The analysis includes the identification of sources, coverage, time frame available, frequency of collection, geographic unit of analysis, format in which the data is available, and the method by which it is obtained. Data was available for certain indicators to enable the project staff to produce historical or baseline trends.</td>
</tr>
<tr>
<td>IV. Recommended Data Source(s)</td>
<td>If there is insufficient data available to support the indicator then alternative sources are identified.</td>
</tr>
<tr>
<td>V. Proposed Data Collection Process</td>
<td>This section identifies how the data might be obtained if sufficient data does not exist. Two pieces of information are disclosed:</td>
</tr>
<tr>
<td></td>
<td>• research references which contain a method for data collection; and</td>
</tr>
<tr>
<td></td>
<td>• a brief overview of how a data collection process might be conducted.</td>
</tr>
<tr>
<td>VI. Level of Effort Assessment</td>
<td>Seven levels of effort were developed to reflect the level of effort needed to obtain new data. The criteria used for assigning levels of effort are provided in Table 7.2.</td>
</tr>
</tbody>
</table>
Goal # 1

PROVIDE SAFE, RELIABLE, CONVENIENT ACCESS

</tbody>
</table>
# Goal #3: Reduce Pollutants from the Transportation System

## Category

| I. Proposed Indicator (as per data source) | Pollutant mix in water runoff from highways |
| II. Explanation of Proposed Indicator | Research conducted at the University of Washington for WSDOT from 1977 to 1982 has established that among a host of variables, highway runoff quality is most highly correlated with  
- the number of vehicles passing by a given point, and  
- the purification potential of vegetation in the right of way downslope from the paved surface.  
Therefore, average daily trips in conjunction with purification potential of vegetation can be used as a predictor of runoff quality. Purification potential is defined as the ability of the vegetative cover in the right-of-way to remove pollutants from highway runoff. |
| III. Current Data Availability | Permanent Traffic Recorder System (PTR) for traffic volumes only.  
- Sources  
  - Agency — WSDOT  
  - Unit — Travel Data Branch  
  - Funding — state and federal  
- Coverage  
  state highway system  
- Time Frame Available  
  1965 and on  
- Frequency  
  summarized monthly  
- Geographic Unit of Analysis  
  state highway system  
- Format of Data  
  computer file  
- Method/Measurement Technique  
  continuous survey (see charts which follow) |
| IV. Recommended Data Source(s) | Field survey of highway right-of-way vegetation at sample stations |
| V. Proposed Data Collection Process |  
- Research Documentation  
- Methodology Overview  
  1. Utilize existing PRT data collection process for determining average annual daily traffic.  
  2. Collect vegetation data in field.  
  3. Use model to calculate runoff quality. |
| VI. Level of Effort Assessment — (6) | Data collection needed. Method exists. |
# Washington State Transportation Policy Plan

## Performance Monitoring Demonstration Project

### Indicator Data Assessment Form

**Goal #3: Reduce Pollutants from the Transportation System**

<table>
<thead>
<tr>
<th>Category</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>I. Proposed Indicator</strong> (as per data source)</td>
<td>Number of people exposed to greater than 70 CNEL because of the transportation system</td>
</tr>
<tr>
<td><strong>II. Explanation of Proposed Indicator</strong></td>
<td>The number of individuals exposed to unhealthy levels of noise indicates the overall magnitude of the noise pollution problem. Transportation related sources of noise pollution include highways, trains, and airplanes.</td>
</tr>
<tr>
<td><strong>III. Current Data Availability</strong></td>
<td>Not available</td>
</tr>
<tr>
<td><strong>IV. Recommended Data Source(s)</strong></td>
<td>Monitoring stations, U.S. Census Bureau</td>
</tr>
</tbody>
</table>
  • Methodology Overview 1. Follow process developed in "Monitoring Community Noise" to develop a noise monitoring system. This includes an investment in noise monitors, as well as a central data processing center.  
  2. Estimate the number of people living in excessive noise areas using block level census data. |
| **VI. Level of Effort Assessment — (6)** | The collection of primary data is required, and although a methodology has been developed, it would likely need refining. |
Goal #4

INCLUDE EFFECTIVE URBAN DESIGN IN TRANSPORTATION FACILITIES
GOAL #4: INCLUDE EFFECTIVE URBAN DESIGN IN TRANSPORTATION FACILITIES

<table>
<thead>
<tr>
<th>CATEGORY</th>
<th>DATA</th>
</tr>
</thead>
<tbody>
<tr>
<td>I. Proposed Indicator (as per data source)</td>
<td>Percentage of intermodal linkages with all weather designs</td>
</tr>
<tr>
<td>II. Explanation of Proposed Indicator</td>
<td>Focusing on intermodal linkages will help to assess the effectiveness of programs designed to integrate several modes of transportation. Effective urban design at the linkages between modes, such as transit station areas, would increase the overall appeal and efficiency of the transportation system.</td>
</tr>
<tr>
<td>III. Current Data Availability</td>
<td>Not applicable</td>
</tr>
<tr>
<td>IV. Recommended Data Source(s)</td>
<td>Field surveys of transportation systems by jurisdiction.</td>
</tr>
<tr>
<td>V. Proposed Data Collection Process</td>
<td>• Research Documentation</td>
</tr>
<tr>
<td></td>
<td>• Methodology Overview</td>
</tr>
<tr>
<td></td>
<td>Survey transit authorities and private carriers to identify the number of all weather intermodal linkages with their operating jurisdiction.</td>
</tr>
<tr>
<td>VI. Level of Effort Assessment — (7)</td>
<td>The primary collection of data is required, as well as the development of a cost-effective methodology for obtaining the data.</td>
</tr>
</tbody>
</table>

INDICATOR DATA ASSESSMENT FORM

GOAL #4: INCLUDE EFFECTIVE URBAN DESIGN IN TRANSPORTATION FACILITIES

<table>
<thead>
<tr>
<th>CATEGORY</th>
<th>DATA</th>
</tr>
</thead>
<tbody>
<tr>
<td>I. Proposed Indicator (as per data source)</td>
<td>Visual quality rating along state highways</td>
</tr>
<tr>
<td>II. Explanation of Proposed Indicator</td>
<td>The visual experience along a highway plays an important role in how people experience highway travel. Degradation of visual quality will be reflected in people's perceptions of the highway system.</td>
</tr>
<tr>
<td>III. Current Data Availability</td>
<td>None</td>
</tr>
<tr>
<td>IV. Recommended Data Source(s)</td>
<td>Field surveys</td>
</tr>
<tr>
<td></td>
<td>• Methodology Overview 1. Conduct periodic surveys to classify highway segments according to a visual quality classification system.</td>
</tr>
<tr>
<td></td>
<td>2. Monitor percentage of segments in each visual class over time.</td>
</tr>
<tr>
<td>VI. Level of Effort Assessment — (6)</td>
<td>The primary collection of data is required. Method exists.</td>
</tr>
</tbody>
</table>
Goal #5

ASSURE THE PRESERVATION OF THE NEEDED SYSTEM
### GOAL #5: ASSURE THE PRESERVATION OF THE NEEDED SYSTEM

<table>

<td>Data are available at the local level as required by federal and state mandate.</td>
</tr>
</tbody>
</table>
GOAL #5: ASSURE THE PRESERVATION OF THE NEEDED SYSTEM

CATEGORY                DATA

I. Proposed Indicator (as per data source) Operational hours of transit per capita

II. Explanation of Proposed Indicator The ratio of route miles to total population indicates the overall level of service available to the general public. This measures how well the population as a whole is served by public transportation.

III. Current Data Availability For available revenue

   • Sources
      • Agency — UMTA — section 15 reports, WSDOT state annual report, and Six Year Capital and Finance Plans.
      • Unit — varies by agency
      • Funding — local, state and federal

   • Coverage statewide

   • Time Frame Available varies by data source

   • Frequency annual for all three data sources

   • Geographic Unit of Analysis by transit operator jurisdiction

   • Format of Data tabular and computer file

   • Method/Measurement Technique continuous survey

IV. Recommended Data Source(s) Not available

V. Proposed Data Collection Process

   • Research Documentation As indicated

   • Methodology Overview
      1. Identify number of route miles/total population
      2. Report to WSDOT
      3. Repeat process annually

VI. Level of Effort Assessment — (4) Data are available at the local level as required by federal and state mandate.
