

Digital Rendering
Robert Mark Morgan

Using basic techniques in Adobe Photoshop and Dreamweaver, students will use software skills to better visualize their design ideas and immediately apply what they've learned to their designs for professional projects, class projects, and School of Drama related productions.

Specific applications include, but are not limited to:

- Photoshop: techniques are explored as a means of creating design postcards, rendering of light and shapes in space, embellishing hand-drawn sketches, adding details to model photos, and changing color and palette of a costume rendering.
- Dreamweaver: using images created and edited in Photoshop, we will explore using those images in preparing a website for online display of student portfolios.
