

Rachel R. Chapman, Ph.D. (University of California Los Angeles, 1998) Dr. Chapman is a social cultural applied anthropologist. Her current research interests are gender, race, reproductive health and social justice in the urban U.S. and Southern and East Africa. Her research focus is the political economy of race, gender, and reproduction, especially the impact of transglobal policies on reproductive stratification within and outside of the U.S. Dr. Chapman has conducted ethnographic research in Los Angeles, Cleveland and Central Mozambique. She is developing an applied, problem-solving approach to urban health issues across cultures. Her most recent research was conducted in East Cleveland, Ohio on prenatal care, domestic violence and DV screening experiences of women in an urban safety net hospital, and youth resilience and peacemaking, and in Mozambique on women's perceptions of reproductive risk, community health mobilization, and household management of febrile illnesses (malaria) in children. Her new research is collaborative and involves following up women in Mozambique to understand the influence of the HIV epidemic on their daily lives and choices, as well as on why HIV+ pregnant women frequently do not follow up with treatment and what the influence of Pentecostal churches is on HIV treatment seeking in Mozambique and the urban US. What matters most to her is how knowing any of this can improve community health and healthcare. She is currently an assistant professor at UW in the Department of Anthropology.
