Has your family completed genetic testing?

Researchers are seeking participants with Autism Spectrum Disorder or related neurodevelopmental disorders who have a known genetic mutation associated with ASD.

The Investigation of Genetic Exome Research (TIGER) Study is enrolling research participants ages 4 to adult to participate in a new study exploring how specific genetic events may contribute to Autism Spectrum Disorder and related developmental disorders.

Participation includes a visit to the University of Washington in Seattle during which we will conduct a clinical assessment, neurocognitive assessment, EEG, 2 dimension and 3 dimension photos, language testing, medical examination, a blood draw, an optional skin biopsy, and collect a detailed developmental history.

Expenses related to the study visit (such as airfare and lodging) will be covered by the study and subjects will be reimbursed $100 for their participation.

For a list of gene mutations currently being studied, please visit our website:
