Using mathematical models for health economic analyses

Ruanne V Barnabas, MD, DPhil
Assistant Professor, Global Health, Allergy & Infectious Diseases
University of Washington
Outline

- Introduction to modeling
- Infectious disease modeling
  - Introduction; $R_0$
- How models can be used to estimate health outcomes
  - Example: Potential impact of ART for prevention
  - What study data can you use to parameterize models
- When to use which model
An introduction to Mathematical Models

• Framework for understanding and communicating infectious disease*
• Explicit assumptions help delineate which parameters are based on evidence
• Quantitative or qualitative results are compared with observed or experimental data
• Validated models can be used to estimate the potential impact of interventions (e.g. ART for prevention) on health outcomes
  ▪ HIV incidence cases
  ▪ HIV associated death
  ▪ HIV associated disability adjusted life years (DALYs)

Models in health economic analyses

- Used to structure the economic question and compare all relevant alternatives
- Extrapolate beyond observed data
- Link intermediate and final endpoints
- Generalize results to other settings/patient groups
- Synthesize evidence to simulate comparisons where RCTs don’t exist
- Indicate the need for further research

HERC short course, Oxford, 2012
Types of models

• Static models – equilibrium (time-invariant)

• Dynamic models – time dependent change
  ▫ Force of infection can change over time
  ▫ Includes herd immunity

• Both static and dynamic models can be either deterministic or stochastic (constrained random variables)

• Choice of model depends on scientific question
Where do models fit in the path from discovery to implementation?

- Observation
- Clinical Trials
- Implementation Science
- Mathematical Modeling & Health Economic Analyses
- Freezer project

• When to use which model
The basic and effective reproductive numbers

**$R_0$ The Basic Reproductive Number** - The number of new infections caused by one infection in an entirely susceptible population

**$R_t$ The Effective Reproductive Number** - The number of new infections caused by one infection at a given time

$$R_0 = D \cdot C \cdot \beta$$

- Mean length of time infectious
- Rate at which sexual contact occurs
- Likelihood of transmission on a sexual contact

$$R_t = R_0 \cdot \chi$$

- Proportion of contacts susceptible
- Vaccination
$R_0 = 2$

Transmission

No Transmission

Infectious

Susceptible
$R_0 = 2$

$R_t = R_0 \cdot \text{prop susceptible} = 0.5$

Transmission

No Transmission

Infectious

Susceptible

Immune

Models demonstrate potential impact of interventions

Universal voluntary HIV testing with immediate antiretroviral therapy as a strategy for elimination of HIV transmission: a mathematical model

Rouben M. Granich, Charles F. Gilks, Christopher Dye, Kevin M. De Cock, Brian G. Williams

Figure 5: Time trends resulting from application of universal voluntary HIV testing and immediate ART strategy for people who test HIV positive, in combination with other adult prevention interventions that reduce incidence by 40%. The programme implementation start date is arbitrarily set as immediate, with coverage increasing logistically to 50% by 2012 and 90% by 2016.
ART implementation
Models can estimate potential impact of health programs

Treating our way out of the HIV pandemic: could we, would we, should we? *Geoffrey P Garnett, Rebecca F Baggaley

- “HIV prevention is easy in theory – the practice is hard.”
- Need intensive HIV testing and robust linkages to care, even among people who feel well
- Strategies need to be effective and cost effective
Community wide HCT & Linkage to care in South Africa

<table>

ART Model: Structure

- Compartamental, deterministic model for HIV - population level
- Stratified for gender, age, sexual activity classes
- Includes births, HIV-associated deaths & all-cause mortality
- *Force of infection – per susceptible risk of acquiring HIV (fxn – sexual mixing, HIV prevalence, transmission probability)
- Validated for KZN, South Africa

Roger Ying, ISSTDR, 2013
ART Model: Structure

- Mathematical model to evaluate ART scale-up
- Realistic assumptions for ART coverage
  - *32% CD4 ≤ 350 (baseline counterfactual)
  - *80% CD4 ≤ 350 (efficacy)
  - *60% CD4 ≤ 350 (effectiveness)
  - *80% CD4 ≤ 500 (WHO recommendations)

Roger Ying, ISSTDR, 2013
ART Model: Results

Impact of ART: HIV Prevalence

Outline

• Introduction to modeling
• Infectious disease modeling
  ▫ Introduction; Ro
• How models can be used to estimate health outcomes
  • Example: Potential impact of ART for prevention
  • What study data can you use to parameterize models
• When to use which model
What data do we need for models?

- Demographics
- Mixing patterns
- Natural history
- Transmission probability
- Factors that change susceptibility
- Factors that change infectiousness
- Effectiveness of interventions
- Engagement in health care
What study data can you use to parameterize models?

- Country specific demographics
- Distribution of CD4 count and viral load
- Intervention (including treatment) coverage and efficacy – capture cascade of care
- Factors that impact on HIV transmission: viral load, gender, circumcision status, co-infection status
Outline

• Introduction to modeling

  ▫ Introduction; Ro
• How models can be used to estimate health outcomes
  • Example: Potential impact of ART for prevention
  • What study data can you use to parameterize models
• When to use which model
How to choose the appropriate model for health outcomes

What model should I use?

Is the interaction between patients important (e.g. transmission)?

Yes

Do you need to model recursive events?

No

Do you require your model to represent a lot of health states?

Yes

Individual sampling model?

No

Do you need to model individuals?

Yes

Discrete Event Simulation

No

Decision Tree Model

Yes

Markov Model

Adapted from Barton et al. 2004
Summary

• Infectious disease modeling is a useful tool – assumptions are explicit, characterize uncertainty
• Study data can be used to parameterize models
• Models can be used to estimate health outcomes
• Consult with a health economist and/or modeler to choose an appropriate model to answer your question
