Why Collaborate? Why Involve Universities?

By Michael Kern

Several years ago, I participated in a gathering of conservation organizations devoted to the topic of whether collaboration is a good thing. Having spent my career creating opportunities for people to collaborate on complex policy challenges, I was a little surprised to learn that this was not only an open question, there was strong sentiment that the correct answer might be “no.” I wondered how the people voicing this opinion could see collaboration in a negative light (and what their marriages must be like!). Isn’t it—I thought—inherently positive to seek ways to work more effectively with others on a common challenge?

As the meeting progressed, I realized that the skeptics were not thinking about collaboration in this general sense. They were using the term as shorthand for a specific set of processes in which their community was engaged, many of which had left them frustrated and cynical. I was using Webster’s first definition of collaboration: “To work jointly with others or together, especially in an intellectual endeavor.”¹ They were feeling pushed into processes they saw as poorly-designed and unlikely to meet their needs. But they felt they needed to participate, if for no other reason than to prevent agreements from being reached that they found problematic. They feared the outcome would fit Webster’s second definition: “To cooperate with or willingly assist an enemy of one’s country and especially an occupying force.” In fact, one of them illustrated a newsletter article on a collaborative effort with a photo of the president of Nazi-occupied France!

I’ve thought about that gathering many times in subsequent years, especially

¹ Michael Kern received an MPA from the UW Evans School of Public Affairs in 1995. He is the Director of the William D. Ruckelshaus Center, a joint effort between the University of Washington and Washington State University that fosters collaborative public policy in the State of Washington and the Pacific Northwest (more information available at www.ruckelshauscenter.wsu.edu). The Center is hosted by the Evans School and WSU Extension. Michael is on the US Institute for Environmental Conflict Resolution’s (ECR) roster of ECR professionals and has over 20 years of experience helping diverse groups reach common ground on complex public policy issues.
people collaborate effectively only when they want to—or when they believe it is in their best interest to do so—not because they have to.

People collaborate effectively only when they want to—or when they believe it is in their best interest to do so—not because they have to.
An effective collaborative process requires that none of the parties have what they see as a preferable alternative to a collaborative solution (known in the field as a BATNA, or best alternative to a negotiated agreement). All parties must be actively and creatively seeking solutions that work for themselves and others at the table. Ideally, that search is motivated by altruism, camaraderie and a sense of shared purpose. A more reliable motivation is recognition that no individual has the ability to unilaterally impose his or her preferred solution, or to implement that solution without the others’ support. Participants need to be committed to the collaborative process, not participating with one eye on this process and the other on a legislative end-run, legal strategy or other alternatives.

This is one reason why I believe that it is generally not a good idea to make a collaborative process mandatory. People collaborate effectively only when they want to—or when they believe it is in their best interest to do so—not because they have to. It is also why I am not a big fan of charters or ground rules that “hedge their bets” by including majority or super majority voting as a back-up if consensus is not achieved. That back-up plan can remove the incentive for participants to truly commit to addressing each other’s interests and needs, not just their own.

I am, however, a fan of charters or ground rules that provide clarity from the start about how the process will be conducted, including a clear definition of consensus. Too many groups decide they will operate by consensus without clarifying what they mean by the term. A common definition that I’ve seen work well is the following:

The group reaches consensus when each member can say:

- I believe that others understand my point of view.
- I believe I understand others’ point of view.
- Whether or not I prefer this decision, I support it because it was arrived at openly and fairly and is the best solution for us at this time.

Another vital element in a successful collaborative process is a skilled, neutral third party. By this I mean one or more practitioners who do not have a stake in the outcome, are trusted by the parties, provide expertise in collaborative process and problem solving, and have the instincts and other qualities needed to help people communicate effectively and overcome obstacles. I have seen such practitioners come from a variety of backgrounds and institutional settings, and have worked in a number of those settings myself (sole practitioner, non-profit organization, private firm,
Which setting is a preferable source of assistance depends on the situation.

This is certainly true regarding academic settings. At the William D. Ruckelshaus Center, we have criteria to assess whether a potential collaborative policy project is a good fit for our organization and its mission. Perhaps the most important of these is whether there is something unique about university involvement that adds value to the project and makes a successful resolution more likely. This can be for a variety of reasons. For example, universities can contribute applied research and fact finding that helps establish a common information base, addresses uncertainties, and is accepted as neutral where agency or private research may not be. Faculty, staff and affiliated practitioners may have valuable subject matter expertise, facilitation skills and relationships. Universities can involve students, creating a culture of exploration and learning that contributes to creative solutions. Universities are a natural partner when there is a need or desire to incorporate case study or project evaluation elements.

Finally, it is often the case that universities are simply seen by the parties as an accepted and trusted convener. I’ve seen many occasions where individuals and groups will set skepticism aside and give a collaborative process a shot if invited to the table by a university. These situations provide universities with an outstanding opportunity to meet their community service mission, by helping parties explore new ideas, approaches and collaborative solutions.
