

# When is Restoration Complete?

Derek Buchner, School of Environmental and Forest Sciences

## Background

There are 255 parks in Seattle. Each park is split into zones, totaling 1548 zones. Each zone is assigned a Target Forest Type based on site dynamics, like hydrology and slope. Each zone is in the process of reaching or maintaining their Target Forest Type.

Question: When does a forest management transition from restoration to maintenance?

## Objectives

- Determine which zones qualify for long-term maintenance
  - Decide which quantitative criteria are needed for a zone to qualify
  - Develop a data-sheet that quickly captures the site's ecological state
- Create a priority ranking for unqualified sites that guides work prescriptions
