

The Protein Train

The Protein Train has many cars. When the Protein Train arrives at the stomach, all the cars are separated from the engine. New engines arrive to take the cars through the blood to other parts of the body. If no engine comes to pick up the *PHE* car, it won't be taken to other parts of the body. The *PHE* car will stay in the blood and as more and more *PHE* cars arrive there will be too much phe in the blood.

Draw the Protein Train below. Add the *PHE* car to your Protein Train and color your train.
