Wood Chemistry

PSE 406/Chem E 470

Lecture 4

More Sugars: Disaccharides and Rings

PSE 406 - Lecture 4 1

Wood Chemistry

Hemiacetal Formation

A *hemiacetal* is a compound having the C(OH)OR group that results from the reaction of an aldehyde with one mole of an alcohol. Sugar molecules contain an aldehyde group and lots of alcohol groups.

PSE 406 - Lecture 4 2

Wood Chemistry

Hemiacetal Formation in Sugars

Notes

PSE 406 - Lecture 4 3

Wood Chemistry

Important Monosaccharide Projections

Fischer **Haworth** **Chair Configuration**

Notes

PSE 406 - Lecture 4 4

Wood Chemistry **Conformation: The Chair**

a=axial
e=equatorial

Chair β-d-glucopyranose

The most stable form of a sugar in a six membered ring is in the chair formation. The substituent groups on the molecule are either in an axial or equatorial position depending on what gives the most stable molecule. Check out the 3D version of the above sugar on the notes page.

PSE 406 - Lecture 4 5

Wood Chemistry **Conformation: Other Forms**

Boat Skew Boat

We won't be worrying about these forms.

PSE 406 - Lecture 4 6

Wood Chemistry **The Haworth Projection**

- This is a very common way that wood chemists draw sugars in the ring form.
- In this projection, the thick bonds are perpendicular to the plane of the paper

- Substituents are parallel to the plane of the paper and lie either above or below the plane of the molecule

PSE 406 - Lecture 4 7

Wood Chemistry **Formation of Anomers**

- Ring closure creates new chiral center at C1; new pair C1 epimers termed anomers. For d sugars, the following is true:
 - alpha form: OH below the ring
 - beta form: OH above the ring
- For l sugars, the opposite is true.

α-D-glucopyranose
β-D-glucopyranose

PSE 406 - Lecture 4 8

Wood Chemistry **Nomenclature**

β -d-xylopyranose β -d-xylofuranose
 α -d-xylopyranose α -d-xylofuranose

PSE 406 - Lecture 4 9

Wood Chemistry **Mutarotation**

β -d-glucopyranose α -d-glucopyranose
 d-glucose (open chain) d-glucose (hydrate form)
 α -d-glucopyranose β -d-glucopyranose

Notes

PSE 406 - Lecture 4 10

Wood Chemistry **Fischer to Haworth**

- In order to convert a Fischer projection of a sugar to a Haworth projection, certain rules must be followed in order to maintain correct orientation of the molecule.
- Remember, the horizontal bonds in the Fischer projection (solid wedges) are out of the plane and the vertical wedges (broken wedges) are into the plane.

$\begin{array}{c} \text{CH}_3 \\ | \\ \text{H} - \text{C} - \text{OH} \\ | \\ \text{C}_2\text{H}_5 \end{array} \longleftrightarrow \begin{array}{c} \text{CH}_3 \\ | \\ \text{H} - \text{C} - \text{OH} \\ | \\ \text{C}_2\text{H}_5 \end{array}$

PSE 406 - Lecture 4 11

Wood Chemistry **Fischer Formula Manipulation**

- Manipulation of Fischer formulas will change conformation of structures so this must be done carefully as in the following example.

$\begin{array}{c} \text{Br} \\ | \\ \text{H} - \text{C} - \text{CH}_3 \\ | \\ \text{C}_2\text{H}_5 \end{array} \xrightarrow{90^\circ \text{ rotation}} \begin{array}{c} \text{H} \\ | \\ \text{C}_2\text{H}_5 - \text{C} - \text{Br} \\ | \\ \text{CH}_3 \end{array} \xrightarrow{90^\circ \text{ rotation}} \begin{array}{c} \text{CH}_3 \\ | \\ \text{C}_2\text{H}_5 - \text{C} - \text{H} \\ | \\ \text{Br} \end{array}$

exchange groups

$\begin{array}{c} \text{H} \\ | \\ \text{C}_2\text{H}_5 - \text{C} - \text{CH}_3 \\ | \\ \text{Br} \end{array} \xleftarrow{\text{exchange groups}} \begin{array}{c} \text{CH}_3 \\ | \\ \text{C}_2\text{H}_5 - \text{C} - \text{H} \\ | \\ \text{Br} \end{array}$

PSE 406 - Lecture 4 12

Wood Chemistry **Fischer to Haworth**

- Modify the Fischer formula so that all of the ring atoms lie along a vertical line. When rotating substituents around a chiral carbon, to keep the correct configuration, after a 90 rotation, the opposite substituents must be switched.
- Proceed around the Haworth formula placing the groups on the left above the hexagon and those on the right below the plane.

PSE 406 - Lecture 4 13

Wood Chemistry **Monosaccharides D Versus L, Part II**

Mirror Images
(Enantiomers)

PSE 406 - Lecture 4 14

Wood Chemistry **Linkages Between Sugars**

- In the tree, monosaccharides are linked through enzymatic processes.
- Linkage proceeds through a dehydration process (loss of H_2O).
- The bond between the glucoses units in cellobiose is a glycosidic bond. Once linked, the glucose unit on the left is no longer a hemiacetal, it is now an acetal.

Cellobiose
4-O-(β -D-Glucopyranosyl)-D-Glucopyranose

- Cellobiose is disaccharide produced from the partial hydrolysis of cellulose. It is not naturally found in wood.
- The squiggly bond on C1 above means it can be either α or β .

PSE 406 - Lecture 4 15

Wood Chemistry **Linkages Between Sugars**

- The glycosidic linkage between the glucose units is between the β C1 of one glucose to C4 of the other glucose. So this bond is a $\beta(1 \rightarrow 4)$ linkage.
- The glucose molecules in the drawing on the right are opposite to make drawing the $\beta(1 \rightarrow 4)$ linkage easy.

Cellobiose
4-O-(β -D-Glucopyranosyl)-D-Glucopyranose

PSE 406 - Lecture 4 16

Wood Chemistry

Cellulose polymerized by condensation reactions

- Removal of uridine diphosphate (UDP) during polymerization

PSE 406 - Lecture 4 17

Wood Chemistry

More Disaccharides

- Neither of these sugars are found in wood. Sucrose occurs naturally in sugarcane and in sugar beets. Maltose is formed through the degradation of starch.

PSE 406 - Lecture 4 18

Wood Chemistry

Reducing End Groups

- Sugars containing aldehydes and ketones are referred to as reducing sugars.
- These sugars will reduce copper in a specific reducing substances test. The aldehyde or ketone groups are oxidized by the copper.
- Sucrose is not a reducing substance

$$\text{RCHO} + \text{Cu}^{2+} \longrightarrow \text{RCOOH} + \text{Cu}^{1+}$$

PSE 406 - Lecture 4 19
