Infant Brain Imaging Study

Typically Developing Babies Needed

About Our Study

The goal of this NIH-funded brain imaging study is to identify symptoms of autism sooner and increase our understanding of how the brain develops in infants with and without Down syndrome.

Who Is Eligible?

We're looking for families who have an infant under 6 months old and at least one older full sibling with no known developmental delays. These infants will be a comparison group for our Down syndrome and autism studies. Expectant parents are encouraged to contact us.

About Your Visit

Your infant and a parent will:

- Travel to Seattle when infants are 6-months, 12-months, and 24-months old
- Infants complete developmental testing and MRI scan
- MRI scans are completed while infants are naturally sleeping without sedation
- Reimbursement for study related expenses and up to \$300 compensation per visit for participating
